Topic: 1 Message: 1

Hi.

I see there are already a dozen or so new members and none of us even have the radio yet LOL. I own several amateur radios. I just picked up a couple vintage Kenwood SSB HF transceivers TS520S and TS530S. Both have issues but I've already gone through the 530 and got it straightened out. And this radio is clean. Almost new condition in and out.

I have several hand helds. An old Maxon uhf business band re-rocked for .70cm. Some Yaesus and one Wouxun UV6D dual. Been using my FT8900 Yaesu as a base while I figure out why my Icom 706 stopped receiving on 2 meters. So I'm also active in RF communications repair, just no longer on commercial gear.

Hope we don't have long to wait for the Anytone, I'd like to use it mobile. The FT8900 faceplate has no backlighting for the function buttons. Impossible to see in the dark. The Anytone from what the importer says is backlit. And that DTMF mic also looks like it has great backlighting. The Yaesu DTMF backlit mic is woefully insufficiently lit. Other features of the Anytone are removable head and the connections are modular 6P6C| as well as the mic. No word on a bracket to remotely mount the head within but I'm sure they planed on offering one.

Welcome the group and if you have some questions feel free to ask.

Just Joined so this is a test message. And I'm as radio poor as you are apparently :>) If this radio lives up to the what I've read so far, it will replace all three of my FT-7900's and an Alinco DR600T. I can see it becomming a very popular radio for the VFD's around here if the price stays in the $275 range. We use both VHF and UHF, along with two tone sequential tone and voice paging. Wish my Wouxon UV6D had that feature!

LOL "radio poor" I like that description. If I had to use fingers
to count how many radios I've bought, sold, traded I'd have to
use my toes too and even then might not have enough digits.
One thing I'm going to keep an eye open for is a desk microphone
for this TS530S I just acquired. I've decided I'm going to hang
on to it after using it for a couple evenings. It still needs the
coil selector rotary switch that is mounted in the final cage.
The yoke is turned by the band selector shaft and it's dodgy
having a considerable amount more play than I'd like. So I'll
need to expoxy it to the middle wafer or find a replacement.
That and the couplers for the tank circuit tuners (plate and load)
have some small cracks in them being plastic. Some small things
that are just part of the age of the unit. But I love doing the work
and take a lot of pride in it. This radio is near showroom quality
having one previous owner only who didn't smoke.

From: Eugene
Topic: 4 Message: 4

Since this radio is part 90 (Public Safety)approved it would be great if they added mdc encoding with the option of pre, post or both encoding on ppt.

Not knowing much about MDC can you describe how
it is implemented into public safety communications?
Is this used for mobile data?

The tank circuit couplers I can actually make
myself but I'd rather buy them to be honest.
Biggest problem is the slack in the band switch.
It's caused by the wafer switch in the final cage.
It was home engineered maybe 5 years ago but
it might be time to spring for a new switch. But hell
I can't complain, the price $150 was right, the unit
had only two previous owners and other than the
band switch slop and the cracking couplers for plate
and load, it's a mint condition radio. I've gotta crack
open the TS520S before I do more work in the 530.
The 520 works but it sure needs a whole can of Deoxit
and an alignment. That and the new finals need neutralized.
I might pull those and slap them into the 530 who knows?
I got both rigs on condition I pay a nominal price for one
if I can repair the other. I can make a decent deal for both.

Topic: 4 Message: 8

I highly doubt that this radio even though it is part 90 will not have the mdc encoding. This is not a Harris, Bendix King, Kenwood or Motorola costing a couple of grand. This is a very simple plain jane mobile dual band radio.

My own personal part 90 mobile radio does not even have mdc on it. All it is designed to do it simple voice communications and digital on the amateur bands.

What would be even better on this rig is to be firmware upgradable for when 31 dec 2017 rolls around and you have to narrow band again to 6.25 kHz so we would not have to buy another rig in 4 years.

Where did you find that date for a 6.25 mandate for public safety? A FCC search yields no new data (i.e. no information other than there is no mandate).

Thanks,

/Jeff

Jeff the 2017 mandate only applies to 700 mhz public safety.

The narrow mandate of 2013 will not affect low band 30 - 50,
220, 700, 800, 900, Amateur, CB, FRS, GMRS, MURS,
Marine.

This all is according to wirelessradio.net

From: kb1tce
Topic: 12 Message: 12

Heard about this radio a few days ago. I have two dual bander Kenwoods (D710 and V71) and would like another of the V71 ilk. I like the Part 90 cert also.

Now, does anyone know if this rig has a data port for the attachment of, for example, a SignaLink? Or does one have to go through the mic and audio out jacks?

Steve KB1TCE

13. Re: [Anytone_AT-588UV] Data Port?

It has a data port for programming the radio. Likely
serves also as a digital communications port (packet).
So I guess the answer would be a tentative yes since
packet operation would need audio in and out and
a PTT connection.

The 6.25kHz that is listed for the UV-5R is for the channel step. Channel step and bandwidth are two different things.

narrow banding is a term that reflects bandwidth spacing. for many many many years we have been using a bandwidth of 25kHz example: 153.740. 3 digits after the decimal.

now that the fcc and the ntia have mandated narrow banding, this changes the bandwidth to 12.5kHz. in other words, they have cut the 25kHz bandwidth in half, therefore 12.5kHz. now some of the agencies will have a frequency of 153.7455. 4 digits after the decimal.

in order for scanners to listen to these new frequencies, they must be programmed with the all of the frequency channel steps in order to receive the newer frequencies. most scanners now only have 5, 6.25, 10, 12.5, 15, 20, 25, 50kHz. depending on the frequency when you do the math to determine the kHz step, you may need to have a scanner that does also 2.5 or even 7.5kHz. without the proper frequency step programmed, the frequency that you want to listen to will more then likely get rounded up and you will hear nothing but garbled voices.

Six of the new sixteen Splinter Frequencies require a PLL tuning step of 2.5kHz in order to transmit and receive properly. As long as the radios and it does not matter if they are handhelds or mobiles, have 5, 6.25, 12.5, 25, 50 and 100kHz, majority of the narrowband frequencies can be programmed.

However, as an example: if your assigned frequency is 154.6575, then this frequency would not be compatible with any radio that did not have 2.5kHz step.

Here is an easy way to figure this out. To determine if a frequency can be tuned with a particular step, divide the frequency (mHz) by the Step (kHz). If the answer comes out to be a whole number, the radio with the 5, 6.25, 12.5, 25, 50 and 100kHz stepping will tune. If the answer comes out to be a decimal, then your radio must have the 2.5kHz step. If it does not, it will not tune, therefore no transmit.

Math example:
154.6525 / .0050 which is 5kHz step = 30930.5. in this example, the frequency answer has a decimal, therefore the 5kHz step equipped radio will not tune this frequency.

154.6525 / .0025 which is 2.5kHz step = 61861. in this example, the frequency answer has no decimal (whole number), therefore the 2.5kHz step equipped radio will tune this frequency.

```
Frequency Step Required
154.6500 5kHz
154.6525 2.5kHz
154 6550 5kHz
154.6575 2.5kHz
154.6600 5kHz
154.6625 6.25kHz
```

From: hsumaverick01
Topic: 15 Message: 15

I have been trying to do research and am wondering if this is Anytone's first radio that will be be approved by the FCC?

16. Re: [Anytone_AT-588UV] Question

I'm not sure, but if you check out this site: http://www.blackboxradios.com/ it looks like the commercial side of the same company. Like I said, not sure about all that..

That does look like the AT588 220 rig. Couldn't swear
who makes it. I'll email the importer and see if I can get
some answers.

Per my importer it is not the same company. However
they do make decent radio gear none the less. I do trust my
importer but the front facade and bezel of the Blackbox
looks identical to another radio sporting the AT558 badge.
Notice there is no UV suffix. Now those two radios
may be made by the same company but not the one that
makes our dual band amateur AT588UV radio. Getting pretty
confusing huh? There is also a www.anytone.com.cn that
makes power accessories for iPads, iPods stuff like that
that is in another town or province from where all these
radios like the Wouxun, Beofang, Anytone, Black Box
radios are made that being Fujian, right on the coast and
surprisingly just a couple hundred miles from Taiwan
in the Cina Sea.

All I can find myself is they comply with Part 90.
The radio is still a bit of an enigma. I guess it
will be that way until they square away things
like firmware quirks or design mods. Hopefully
they will get it sorted out and I'll get one in my
hands soon. Right now my importer has a prototype
and he has good things to say about it. He had
been ready to sell the Wouxun KG-UV920R
dual bander but it turned out to be a disappointment.

I never asked what the problem with the Wouxun was.
I own a UV6D amateur band version Wouxun and it
is a decent little radio. It does have some quirks to it
but nothing really major. I'd say right now have a little
patience. My importer is throughly testing his sample
and working with the manufacturer by giving them
feedback on changes they might make to the firmware
among other things. So if he likes what he's seeing now
that's good enough for me. He's a fellow ham so he's
well suited for the job.

My advice would be to save some $$$$$ for it and be patient.
If for some odd reason the AT588UV doesn't pan out then
you've got a start at a more expensive but established rig.

I think we were on the part 90 band narrowing issue yesterday.
From what I understand it only affects 700mhz public safety.
And even by 2017 I think band narrowing mandates still
stays away from vhf 152 - 170, and uhf 430 - 475. But please
don't quote me on those exact numbers.

I've uploaded that software for everyone's convenience
to: http://groups.yahoo.com/group/Anytone_AT-588UV/files/

From what I've read there will be 10 radios available
around the first of October and more arriving later
towards the month's end.

I have downloaded the software and so far it looks decent compared to the Baofeng software offering. Kinda reminds one of Chirp in a way?

Looking forward to availability of product.

I could get used to this software. I like the ">>" (More) cell. A double-click pops up edit window similar the CHIRP right-click|edit window. I did notice a couple of cosmetic 'bugs' already. I believe there are some places where the interface says "SM" when I believe it means "FM".

Topic: 31 Message: 31

Here are two links I looked at when searching for information on the AT-588. They call it the AT-588 (no UV at the end of the model number). I do not see any mention of a programming cable available for the radio either.

http://www.alibaba.com/product-gs/594356826/AT_588_Hot_top_brand_Anytone.html?s=p

http://www.alibaba.com/product-gs/642518707/High_programmed_Professional_Anytone_50W_vhf.html

Is this the same model that we are looking at?

JIM,

THAT'S WHAT HAPPENS WHEN I GET UP EARLY, I START GETTING INTO
TROUBLE.

THIS LOOKS LIKE THE RADIO FOR ME, THE WOUXUN 920 JUST DOESN'T
CUT IT FOR MY USE. I DO HAVE A KG-UV6D V2 AND LIKE MOST OF IT. IT IS
TOO BAD THE MFGR DOESN'T HAVE A WELL THOUGHT OUT USERS MANUAL,
IT LEAVES A LOT TO BE DESIRED.

I WON'T BUY ANOTHER UNIDEN UNTIL THEY PUT OUT A USER MANUAL FOR THE
SPECIFIC UNIT, UNLIKE THE BCT15X. TOO OLD AND TOO BUSY TO SIT AROUND
TRYING TO READ THAT LITTLE DINKY PRINT.

OH FOR THE DAYS WHEN YOU JUST TWISTED KNOBS, FLIPPED SWITCHES AND
TWEEKED A PIECE OF WIRE.

The Anytone AT-588UV is manufactured by Qixiang Electron Science & Technologies.
The Anytone AT-588 is manufactured by Quanzhou Qiaoxing Communication Equipment.

Qixiang manfactures quite a few different lines of communications equipment. Here is there home page.

This is not correct. Both AT-588 (single band mobile) and AT-588UV (dual band mobile) are made by Qixiang Electron Science & Technologies. Quanzhou Qiaoxing Communication Equipment is a sourcing company selling any brand of radio they can get.

I think I need to learn Chinese Ed LOL!
according to Qixiang the AT588 is a dual band
on one URL then a single band at
http://www.qxdz.cn/en/ProductView.Asp?ID=41

Maybe because they use the same model number
for both vhf and uhf models?

That and it's hard to make heads or tails out
of the actual manufacturers and the sourcing
companies. I don't know how you do it.
I'll be happy to get the AT588UV when they
finally get here.

it's actually not terribly bad.
Probably a bit confusing for someone unfamiliar with the standard functions of an amateur transceiver though.
I'm currently (about 40 per cent done) editing a TXT version of the manual and will let everyone know when it's finished.
I am leaving most of the more interesting pros intact for entertainment value.
Anything that offers too much confusion is being changed a little bit to clerify what is being said...IE extra wording or redundant words etc.
There is probably some copyright issue here, but it's for personal use and the use of anyone else who wants something that makes more sence.
overall, this manual is actually one of the better chinglish documents I've come across. It seems as though they did make some kind of effort to write it clearly and reduce most of the confusion.

although, if someone could write up a simple key layout for the front pannel and microphone, that would really help to insert the proper key names into the text document.
All I need is name and functions of each control on the front pannel including it's location from left to right, top to bottom.
IE, starting on the top left is such and such key. Below that is such and such control...to the right of this is such and such.
being blind, I can't use the photos online.

Did a quick scan of the manual and the only negative so far (for me anyway) is the lack of a dedicated data port. Data, of course, can be tied in through the mic and audio out jacks, just not as elegant or convenient. It also precludes the simple mixing of voice and data for emcomm.

Thanks for taking the time. And I wouldn't worry about copyright issues, others have re-written other owner/user manuals for Yaesu and Wouxun. The Chinese are notorious for their translation to English issues. They often describe things in ways English speaking amateurs would never arrange wording for.

48. Re: Detachable Control Head (CAT5 separation cable)

Yahoo group: Anytone_AT-588UV
Date: 2012-09-24 15:27:36 UTC
From: Milton Hywatt
Topic: 48 Message: 48

The radio seems to be undergoing a cosmetic metamorphosis.
The pictures Ed uploaded of the radio don't exactly match the
radio as shown at the manufacturer's site
http://www.qxdz.cn/en/ProductView.Asp?ID=43

You'll notice that this version has different button arrangement
on the left. And the microphone as show at http://www.wouxun.us/
is quite different from the one shown at www.qxdz.cn
Ed's photos depict separation. The PDF file does not nor do
the list of accessories admit its existence.

Problem is for me what radio will we be getting? I'm sure as the
week(s) progress we'll get some updates. However I would expect
nothing less than a data port for programming and possibly packet
and a radio head that can be separated. Those are desirable features
and the Chinese seem to be very interested in providing them. After
finding out how the competition is in the portable/mobile radio business
in China it wouldn't be profitable to not include common features
and accessories.

According to this: http://www.wouxun.us/item.php?item_id=294&category_id=64

... this unit features a Detachable Control Head.

However, in the manual here:
http://www.wouxun.us/Software/AnyTone-Software/AT-588UV_manual.pdf

... I see no reference to such a feature. Is this an error on the website or a missing
feature in the manual?

Can I assume by the file name that software
works with the AT-588UV? What in particular
are you trying to do with the software that you
don't understand? I've found that if you study
the software you find it is actually just an extension
of the user's manual and your fingers.

I definitely see in the manual where it identifies there's a detachable head, but it does not say anything about the connection or a mounting kit for it. This paragraph is on the page right before the Table of Contents.

AT-588UV has four independent receiving bands, consist of UU, UV,VU,VV for dual receive and dual output, plus receiving for AM/FM signal of air band, marine band, PMR, etc. also able to receive FM/TV radio and analogue TV signal. It owns 758 memory channels, full duplex operation with independent volume and squelch controls, optional compander and builtin CTCSS/ DCS, DTMF, 5TONE,2TONE signaling, detachable front panel for flexible installation.

I do notice that now. Must have skipped over it. Also I notice that programming and cloning seems like it will be done via the microphone jack. So that means digital mode operations like packet will use the mic jack via an 8P8C connector for PTT and data out from the TNC. Data back to the TNC will be via the ext speaker jack. And for programming a USB to 8P8C cable would be used and done via the mic jack. These are just best guesses from the description in the manual. But keep in mind the radio in this manual is cosmetically different than the radio seen at: http://www.qxdz.cn/en/index.asp which I believe to be the manufacturer's site.

Since the radio and mic are cosmetically different, there may be some additional connections. Also on that site the radio and mic shown here: http://www.qxdz.cn/en/ProductView.Asp?ID=43

Both show cosmetic changes to the mic and radio from what is show when you fly your cursor of the Key Features tab. I'm going to take a wild guess and say that is the current cosmetic iteration of the radio. It also looks as if somewhere in the enigmatic plans, there could be an ignition controlled on and off feature allowing the radio to turn off and on via your ignition switch. I'm not sure that's such a great idea. There is a considerable voltage sag when you engage the starter motor. And it could be possible to get some voltage spikes before your voltage regulator stabilizes. As far as the separation kit goes, I would 99.9% guaranty there will be the ability to separate. Will a kit be available like the cord and a bezel for the radio head? Maybe not right away but the likelyhood that the radio can be separated by a CAT5 cable with modular ends is very high.

Thanks for taking the time. And I wouldn't worry about copyright issues, others have re-written other owner/user manuals for Yaesu and Wouxun. The Chinese are notorious for their translation to English issues. They often describe things in ways English speaking amateurs would never arrange wording for.

it's actually not terribly bad.
Probably a bit confusing for someone unfamiliar with the standard functions of an amateur transceiver though.
I'm currently (about 40 per cent done) editing a TXT version of the manual and will let everyone know when it's finished.
I am leaving most of the more interesting pros intact for entertainment value.
Anything that offers too much confusion is being changed a little bit to clerify what is being said...IE extra wording or redundant words etc.
There is probably some copyright issue here, but it's for personal use and the use of anyone else who wants something that makes more sence.
overall, this manual is actually one of the better chinglish documents I've come across. It seems as though they did make some kind of effort to write it clearly and reduce most of the confusion.

although, if someone could write up a simple key layout for the front pannel and microphone, that would really help to insert the proper key names into the text document.
All I need is name and functions of each control on the front pannel including it's location from left to right, top to bottom.
IE, starting on the top left is such and such key. Below that is such and such control...to the right of this is such and such.

being blind, I can't use the photos online.

I just received a .pdf copy of the owners manual but it is a little to large to upload to the Files section.

It can be downloaded (5.6 MB)from my site
http://AT-588UV.com/Software/AnyTone-Software/AT-588UV_manual.pdf

I haven't had a chance to proof read it yet, hopefully it won't be too bad.

the manual indicates a single 50ohm antenna connection, which leads me to believe it has a built in diplexer.
It's been a while since dual band radios had separate antenna connections for the different bands.
Also, this radio has full cross band repeat capability, which means it would have to have a built in diplexer to accomidate that.

the manual also talks about the "external power" connecter which, acts much like the remote line on a car stereo amplifier...allowing you to activate a relay inside the radio to turn on and off the regular DC power.
Handy feature actually since lots of people use a relay in their vehicles to turn the radio on and off via an accessory power terminal controled by the key.

I'm not sure I want my radio to turn on while starting the
engine. I posted why in another thread. Also a whole lot
of newer vehicles the cig or acc jacks remain powered
after the vehicle is turned off. On my Chevy SUV, the acc
jack beside the cig jack in the front stays on for 10 minutes.
Now that wouldn't be too bad but a lot stay powered
so you don't have to have a key in the ignition turned to acc.

As far as the built in duplexer goes my Yaesu FT8900
is a quad band and has all four going out one SO239.

you certainly don't have to use that feature.
It is an optional convenience if you have the wherewithal to utilize it...IE, you have an ignition controlled connection somewhere on the inside fuse panel.
otherwise, it can be turned on/off in the menus.
allot of guys I know use one of those blade fuse connecters with a pigtail on it, and they wire up a 50amp relay that closes when you supply voltage to it...so they have the radio or radios wired directly to the battery with the relay inline, and use the fuse panel connection via the pigtail to open and close the relay...sorry that was a bit ragged, but I think you get the general idea.
this radio just put that relay inside the radio so you only have to supply an ignition switched dc source to it.
I don't use these because I like to be able to have the radio on when ever I want without needing the key to turn the ignition. Also, I set APO to an hour so that the radio turns off if I forget to turn it off when I get out of the vehicle.

oh, and this radio also has remote commands where you can start, stunn, or kill the radio remotely via DTMF if needed...
Presumably if you have this turned on, the radio is put into a sleep mode so that a properly received DTMF string can wake it up...excellent for x-band repeater control.

i am trying to learn about the software for the at-588uv, because i plan to purchase one once they hit the market. there is no help file (about) and some of the terminology is strange
to me. ie: channel edit, normal, limit, hyper 1 & 2. there are 758 channels but the users manual
indicates there are 4 independent receiving bands, how to set what channel goes where and many other questions.

Can I assume by the file name that software
works with the AT-588UV? What in particular
are you trying to do with the software that you
don't understand? I've found that if you study
the software you find it is actually just an extension
of the user's manual and your fingers.

I'm sure many will take advantage of the feature. Personally all I need is the radio to shut down on its own. And from working for almost 30 years on mobile communications gear I'm a little fearful of having the radio on while starting the engine. I've seen my fair share of repairs where the only plausible explanation for failure was input voltage related. One good example was a customer who kept returning a radio that the voltage regulator kept failing. After 3 repairs I knew it was not the fault of the radio. This person left the radio on from the time the vehicle was in service to the time it was parked. I told him the radio had to be getting a voltage spike and he might need the vehicle serviced. But in the mean time to shut the radio off before starting the engine. He complied and that cured the problem. Eventually the vehicle was serviced and found to have a defective voltage regulator that caused a short duration spike of about 18 volts when started.

□
you certainly don't have to use that
feature.
It is an optional convenience if you have the
wherewithal to utilize it...IE, you have an ignition controlled connection
somewhere on the inside fuse panel.
otherwise, it can be turned on/off in the
menus.
allot of guys I know use one of those blade fuse
connecters with a pigtail on it, and they wire up a 50amp relay that closes when
you supply voltage to it...so they have the radio or radios wired directly to
the battery with the relay inline, and use the fuse panel connection via the
pigtail to open and close the relay...sorry that was a bit ragged, but I think
you get the general idea.
this radio just put that relay inside the radio so
you only have to supply an ignition switched dc source to it.
I don't use these because I like to be able to have
the radio on when ever I want without needing the key to turn the
ignition. Also, I set APO to an hour so that the radio turns off if I
forget to turn it off when I get out of the vehicle.

Once we get some radios in this country we'll get some hands
on with programming the radio via software. I'm pretty sharp
when it comes to learning what the software can do without
any instructs. Trial and error. So hold tight and once I can
get a radio on the bench I can provide some assistance. Hopefully
a real software manual will show up with the first shipment
of these radios. When that happen it will be available in the group's
software depot.

66. crossband repeat performance

Yahoo group: Anytone_AT-588UV
Date: 2012-09-25 19:39:16 UTC
From: iapx432
Topic: 66 Message: 66

This is one feature that I'm keenly interested in. I had just been about to pull the trigger on a second Kenwood TM-V71 when I saw Ed's announcement about the AnyTone.

Prior to the Kenwood, I had been using an Alinco DR-635T for crossband remote base duty. The thing that killed me on the Alinco was the latency. It takes about a half second between PTT key down on the HT and retransmit from the 635.

The TM-V71 is much better in this respect. The latency subjectively is near zero. The diplexer isolation seems more robust as well.

I hope the AnyTone holds up. Or if it doesn't, then maybe it'll at least push prices down on the Kenwood.

67. Re: [Anytone_AT-588UV] crossband repeat performance

I use a Yaesu FT8900 for x-band to 2 meters. In particular one 2 meter repeater I can't hit inside the house with an HT. This repeater does not require tone but will generate tone when its squelch is open. Meaning no tone generated during the repeater tail. This is ok except I have to wait for the repeater to drop before the FT8900 will go back to repeater operation. So I have to use the tone/tone-squelch that the repeater generates on the x-band repeater and the HT. This is nice also because it suppresses periodic repeater ID's. Hopefully the AT588UV will perform equally although my vehicle will get the AT588UV and the 8900 inside. I won't be using it on 10 or 6 meters in the vehicle but I do as a base. Hopefully I'll have a 588UV here in a couple weeks and can give some answers from experience instead of guesswork.

Topic: 68 Message: 68

They always seem to omit the ability to insert, copy and delete individual lines.

I just looked at the beta software and these features seem absent.

It is that way with the Wouxun software also.

No import feature either.

They need to look at a piece of RT Systems programming software and do what they do well. Copy it.

I will buy this radio because I want to try it out but perhaps 1 day they will seriously address programming features (the lack thereof).

Not trying to upset anyone, just my two cent worth. hmm,, whats that these days,,, 0.25 of a cent,, Inflation,, go figure..

When I think about the nice features, I also try to remember, I wanted a lower price point. Maybe its wroth a lil time to figure out more myself, or retype my listing. Just makes me plan it out better before I start, and make changes less.

Anyway, It would be nice to have a copy/paste/insert feature,, I do agree with ya. I just also look at the sticker to remember why I dont have those extra features...

;)

Before I had the gumption to dig out my old Radio Shack USB Serial converter
and my serial cable for the FT8100 I used to own I just programmed everything
into the 8900 by hand including alpha tags. And that was for around 45 channels :)
I sat in my recliner, put the radio on a power supply and sat back and hand entered
everything. I think it took my all of 1.5 hours once I got into the swing or rhythm
of pushing buttons and knobs. What would be nice for the AT588UV software is
the ability to import from radioreference.com. I did that with my Chinese made
GRE PSR-600. It would have been nearly impossible to program digital trunking
systems with those endless talk groups, group IDs etc... I've done it with an old
analog trunking scanner it it was no easy feat. Since the software is in beta who knows
what the release version will offer. And maybe someone from Chirp or The Commander
guy will write some code to modify the Commander software he's already written.
Also I'm not sure how long after the radios arrive will the cables be available. The radio
looks like it clones through the microphone ports. Maybe they will include a cable?
Too early to tell.

I stand by your though completely. So many seem to forget the price point with not only this radio but some of the other new ones coming out.

You can't expect to buy a Mercedes at a Chevrolet price, you shouldn't expect to buy a low priced radio with all the bells and whistles of a high priced radio either. If you can't live without those features, then spend the money for the radio that does.

I am especially amused because I look at it from a different perspective. Since the radio is Part 90 Certified, the radio has an excellent price and it happens to do ham radio also.

Yes, but if you look at the manual the Programming Software is listed as an OPTIONAL item. Not included in the radio purchase. So is the programming cable!

Now, it might actually be given free or downloadable in the end but for now it is listed as something that will be extra cost.

That being the case they could do an RT systems type full feature programming software and recoup cost thru software pricing - not the radio pricing.

There ain't no free lunches but simple copy, paste, insert, line deletions do not require costly programming and save the end user much time with modifying the units programming.

I'm not saying that I disagree with the features that are being discussed for the software, but if you think having to pay $25 even $50 is going to get you that, think again.

You should take a look at the crap that Icom, Kenwood and others pawn off as programming software for COMMERCIAL GRADE radios...and they cost hundreds of dollars each.

I was just going to mention commercial programming software.
it's way worse than any of the chinese stuff.
try digging into vertex, or motorola, or even icom or kenwood repeater programming software...good luck.
try programming a gm300 some time...then you'll see how this chinese stuff is actually rather user friendly lol.
also, once this at588uv has been out for a couple months, chirp will work with it, and then you'll have far more user control over things like copy paste edit delete etc.

Motorola service software YUCK. Some of the most
convoluted software I've ever used. Same with GE and
EF Johnson. When you are programming land mobile
equipment using binary data input, totally foreign to
the non-coder type the Chinese software is very
user friendly.

Having a little discussion in another amateur group
someone's signature was brought up. The concern of
one person was that signing off with 73's wasn't correct.
I've always signed on CW 73 de (callsign) and simply
73 on SSB and FM. Basically 73 is a more modern adaption
of 1800's telegraph code from Western Union. I take 73
as a sign of fraternalism, "best regards." Some out there
still sign with 73's which might sound like a little nit pickery
on my part should not be pluralized in voice. So I bring this
to you all. 73 or 73's or don't really care ?

technically speaking, 73 (singular) is the indicator of a series of transmissions that have come to a conclusion.
So you say "73" not 73's, or seventy thirds.
saying or typing 73's is redundant...it's like saying "good bye's" instead of "good bye."
I suppose if you are signing with more than one person, you could say 73's so it becomes inclusive to all stations...and that may be why many hams use that in their email signature lines to be more inclusive to the entire group instead of one person.
Personally I don't care, it means what it means and I know the spirit in which it is given.

That makes good sense. If you're in a qso with several
and your sign out for the night maybe then 73's might not
seems wrong to the nit picker. Funny thing in the other
group the moderator had to step in and close the subject.
I probably won't be doing much of that here unless I get
multiple complaints via email and then maybe only try
to do my job and moderate, not become the prosecutor,
judge, and jury all wrapped into one. However don't take
my easy going personality as a sign of weakness :)

Yeh I don't use use it much in phone mode unless it slips out.
I usually say catch y'all later I'm outta here then follow with
my call. Then wait around for a bit for some of the stragglers
to get back with me if they want to tuck the sheets in personally.
One thing that really grinds my gizzard is when someone refers
to themselves as 'we'. But that's a whole nuther topic we probably should
avoid

there is something to do with the rhythm of the 7 and the 3 back to back in cw that became a great way to sign in the early days of cw.
Same thing with sending a "k" at the end of each transmission. There was a good reason for it at one time, which has since been lost.

just another one of our quirky ham things.

Also with all these no-code amateurs around now what I
still consider a fundamental part of amateur communications,
one that set use apart from the others was the ability to use
Morse code. And that seems to be taking a back seat. It is
also a great skill to possess in emergencies
where other modes would not be heard, CW could be notched,
narrowed, digitally filtered, shifted, shelved and otherwise brick
wall filtered so it could be picked out of QRP stations during
severe noise levels and poor propagation. And we got to face it that
one day when (and not if) the sh** hits the fan and we lose communications
networks and grids that there will be hams out there with just the basics
and a paddle or iambic keyer communicating thousands of miles apart.
Both my wife and my son are amateurs. Both know and have retained
proficiency to pass the coded General class test.

WELL SAID MILT,
NOT ONLY THAT, IT IS A HECK OF A LOT EASIER TO HEAR 'CW' THROUGH THE CRAP
WHEN ONE HAS A HEARING PROBLEM. GOT MY TICKET IN '81 AND WORKED NOTHING BUT
CW. IN THE MID 80'S, HAMMING WENT ON THE BACK BURNER, THEN AT THE TURN OF THE
CENTURY VHF AND EMERGENCY COMMUNICATIONS TOOK OVER. DID GET ON FOR THE PAQSO
A FEW TIMES AND A FIELD DAY OR TWO. ALL OTHER CONTACTS WERE CW, RTTY AND DIGITAL
A FEW TIMES.

OH, IT TOOK ME 22 YEARS TO LEARN 'CW' UNTIL ONE DAY I JUST DECIDED TO SIT DOWN AND
DO IT.

Subject: [Anytone_AT-588UV] OT: How do you sign?

Having a little discussion in another amateur group
someone's signature was brought up. The concern of
one person was that signing off with 73's wasn't correct.
I've always signed on CW 73 de (callsign) and simply
73 on SSB and FM. Basically 73 is a more modern adaption
of 1800's telegraph code from Western Union. I take 73
as a sign of fraternalism, "best regards." Some out there

still sign with 73's which might sound like a little nit pickery on my part should not be pluralized in voice. So I bring this to you all. 73 or 73's or don't really care ?

there is some merit to your point.
and I guess since there isn't any big news on the at588uv, we should keep the list alive even if this isn't necessarily directly related to this model of radio lol.

While I think CW is very good to know and keep viable for all the reasons you stated, so is knowing how to build antennas, and understanding how propagation works, and which bands work the best for certain distances and to certain parts of your region, country or the world.
Knowing how to put up an effective and efficient antenna for all HF, VHF and UHF bands out of common junk metal and common wire etc. is just as important as knowing how to send and receive Morse code.
you can be the best cw op around, but if you know little about how to get your signal to where it needs to go, it won't do you any good.
I suspect most hams who make an effort to learn cw, or who know it from earlier years, are typically the ones who have a better working knowledge of antennas and propagation etc.
But I run into so very many ARES types who are all enthusiastic about preparedness, and emergency communications and all that...but don't have a clue how antennas or propagation works or even what they have to do to get a working HF station on the air.
They have a couple hand helds, maybe an extra battery or two, a mobile and perhaps some APRS capability and they think they're good to go if the world ends.
They would be absolutely lost if their HT antenna ever broke and they had to come up with a quick and dirty, yet effective solution to get on the air.
And heaven forbid if all the repeaters failed...
I think out of maybe 50 active ARES members around here, 2 of them have a general idea of how to build and erect an HF antenna.

anyway, there is my half rant for today :)

Also with all these no-code amateurs around now what I
still consider a fundamental part of amateur communications,
one that set use apart from the others was the ability to use
Morse code. And that seems to be taking a back seat. It is
also a great skill to possess in emergencies
where other modes would not be heard, CW could be notched,
narrowed, digitally filtered, shifted, shelved and otherwise brick
wall filtered so it could be picked out of QRP stations during
severe noise levels and poor propagation. And we got to face it that
one day when (and not if) the sh** hits the fan and we lose communications

networks and grids that there will be hams out there with just the basics
and a paddle or iambic keyer communicating thousands of miles apart.
Both my wife and my son are amateurs. Both know and have retained
proficiency to pass the coded General class test.

there is something to do with the rhythm of the 7 and the 3 back to back in cw that became a great way to sign in the early days of cw.
Same thing with sending a "k" at the end of each transmission. There was a good reason for it at one time, which has since been lost.

just another one of our quirky ham things.

technically speaking, 73 (singular) is the indicator of a series of transmissions that have come to a conclusion.
So you say "73" not 73's, or seventy thirds.
saying or typing 73's is redundant...it's like saying "good bye's" instead of "good bye."
I suppose if you are signing with more than one person, you could say 73's so it becomes inclusive to all stations...and that may be why many hams use that in their email signature lines to be more inclusive to the entire group instead of one person.

Personally I don't care, it means what it means and I know the spirit in which it is given.

I'm sorry if I was being perceived implying CW was
the only element in amateur communications. Actually
I said it was one fundamental part that I consider important.
And that only makes it my opinions. As far as this being
discussed in the AT-588UV group goes, being the list
owner I've decided that even though off topic, seeing it's
been a few slow news days for any new news regarding
the AT-588UV, that I might try to stir up some chatter
of any valid amateur kind to get to know the more active
of the list members. If you joined the list for one reason only
that being AT-588UV news and support then I would ask
you to let some of the OT chatter slide for now. I'm sure
once the radios are imported and start selling like I think
they will, there won't be any time for OT chatter. Thanks
for your input Colin it is certainly important and appreciated.

Excellent stuff.
Well, my ham bio is fairly brief at this point
I have been licensed since April of 2005.
Industry Canada, our equivalent to the FCC, changed the amateur radio service regulations along about august of that same year.
I was aware of the up coming changes when I took my test.
Basically, what they did, was changed it so that if you received a mark of 80 per cent or better on your basic license test, you obtained all HF privileges. That means all parts of all amateur radio bands all mode.
Prior to august of 2005, you would need a CW certification of 5WPM to obtain those same privileges.
However, the clincher was that anyone who was licensed between april of 2001, and august of 2005, would automatically be grandfathered into the new regs with full HF privileges if they hadn't already obtained their 5WPM cw certification.
So, I scored far higher than 80 per cent on my exam, and, I was grandfathered into the new regulation scheme.
We have two licensing schemes in Canada, basic, and advanced.
The major differences between those are that a basic license holder is limited to 525W pep output on SSB, and 250W output on FM above 30MHZ.
Also, a basic license holder may not modify or repair his or her own transmitting equipment, except for bands starting at 1.2GHZ and higher. If you have an advanced license, you are allowed to operate up to 2350W pep on ssb, and 1000W on fm. You are also allowed to be the control operator of a repeater, build and modify all your own transmitting equipment, and use commercial radio equipment on amateur frequencies.
Currently I hold a basic license, but am slowly learning the required theory for the advanced license exam.

I am very active on HF from 80M through 6M, particularly 10 when it's open, and 15 and 20M.

I am also very active on local VHF and UHF repeaters and I'm active in our largest local club, as well as with a couple informal groups of hams.

So there you go, more than you ever needed to know about VA6BKX hi.

93. Separation Kit

Yahoo group: Anytone_AT-588UV
Date: 2012-09-30 23:25:52 UTC
From: dr_bob7704
Topic: 93 Message: 93

Has anyone heard anything regarding a separation kit? In particular, a mount for the head. It seems that a CAT-5 cable (shielded) will work. I was sorry to see that the mic connection is part of the head. Limits the locations for placing the head.

well, not as bad as having the mic connecter on the body of the radio...if you put it back in your trunk or under the back seat or something, you would have to run another extension cable for your mic along with the control head cable.
I think having the mic connecter on the head makes a whole lot more sence because most installations are going to put the control head fairly close to the driver and the microphone, which you hold and want close by, plugs into that.
It's no big deal to put in a short extension for the mic though if you need to.

It's the same way on the Yaesu 8900. Modular connector
on the side of the control head. However you can extend
the length of the mic cord several feet by using a modular
female to female 8P8C adaptor. I've used them with CAT5
jumpers without any problem. Wouldn't be too much of a hassle
if you had the control head bracket and you wanted to mount it
flush in your dash or in an overhead console. I feel the control head
is going to be mounted close enough to see clearly and within arm's
reach so the stock mic should be fine.

96. FCC Part 90 Certified

Yahoo group: Anytone_AT-588UV
Date: 2012-10-02 15:50:53 UTC
From: donritchie@sbcglobal.net
Topic: 78 Message: 96

As an attempt to get back "on topic", I have
a couple questions about FCC Type acceptance.

While the Ad says that the radio IS "FCC Part 90 Certified"
I can find nothing on the FCC web site that says this.
Are there any other "numbers" associated with this radio.
The only thing I have to go by is at-588UV, which does not come
up in the FCC Type acceptance web search.
(http://transition.fcc.gov/oet/ea/fccid/)

Any help here?

Thanks

Don K8ZGW

Did you even read the link you sent ??

There is NOTHING that even begins to answer my question,
The newest posting is 4 years old.
There is nothing that said anything about not needing an FCC
number.
or would like it better if I said "certificated" ?

I asked, what does anyone know about the claim that this
radio is FCC Part 90 Certified
I still can not find any "proof" that this radio is FCC Part
90 Certified

I can't help you if you don't know the difference between
certified and accepted. Just like the link says the manufacturer
can swear on a stack of bibles the radio is part 90 certified
but it means nothing until the FCC has accepted it. Since the
radio hasn't started to import into the US yet it won't be unusual
not to find a lot about it and the FCC. I can't find any mention
on the radio manufacturer's site that they claim part 90 certification.
No mention of it in the owner's manual either. I suppose you could
contact them via email and ask directly:
http://www.qxdz.cn/en/contact.Asp?ID=7

There are three email links there.

At this time, these radios are not even in production. As far as I know, I am the only person outside China that even has one. I can assure you that when full production begins, this radio will have FCC Type 90 Certification.

As a side note about certification... This is not done by the FCC per se, it is done by FCC approved facilities. The manufacturer provides the radio to the facility, they perform the testing and if it passes, the certification is granted. This could take as little time as one day. I'm not sure what time lapse there is between getting the application/equipment from the manufacturer and the actual posting of that information on the FCC.gov web site.

I was expecting a preliminary run of these radios early in October. All of China is on holiday for a few more days, then the manufacturers are going to be involved with the electronics show in Hong Kong a week later. My information now is that production will begin in late October, early November. I will be in China next week for a couple weeks and will get some more detailed information.

I have made several suggestions that would improve the operation of this radio, including the addition of a data port and improvements to the mic. Let's hope these things are being considered and give them time to make this already good radio a great radio. Let's not have another debacle like the Wouxun mobile.

Thanks for the update Ed. I think it's a good idea to chill out
and wait and see what develops and have been trying to convey
that. And yes we don't want no Wouxun mobile debacle. Too bad
that radio looked like it had some potential too.

Thanks Ed, this is the kind of information I was hoping for,
as I know how the certification process works,
I just wasn't aware that we were "THAT" early in the production.

I had hands on, on the AT-588UV at the Virginia Beach Hamfest 3 weeks ago. This unit is reall nice but it didn't have the faceplate mount. The dealer didn't have his price on it and wouldn't let his only unit go. I'm waiting for the production run and will place my order. Have fun. Ralph K1KOB

That vendor was one of my dealers, DBJ Radio & Electronics from Jamestown, NC. The radio they have is the first sample AnyTone sent to me for testing. It is a functional radio but had a couple bugs, which they quickly fixed before sending the sample I have now.

From: James
Topic: 107 Message: 107

My supplier backed out of my at-588uv order claiming that there is a chip problem just found. It sounds to me like there testing the waters to see what dealers will pay.

When I placed my order my price was 150 USD p/u. Maybe they want to get higher numbers. I have always delt with the same company wierd.

I'm curious who your supplier would be. I've gotten no information about any problems and a dealer can not even buy 1,000 pieces for $150 each.

I would think Anytone would want much more than $150 per unit.
I'm pretty sure the retail price will end up being $275 or there
abouts.

Ed is headed over to China and no doubt have some updates
when he gets back. If you read his post regarding Chinese
vacations and electronics conventions getting in the way
of starting production, that's a very plausible reason.

$150 sounds low for one and twosie's. This is probably close to the factory to distributor cost. A technical issue at this date is unlikely. More probable your re-seller isn't able to buy at the quantity they need to qualify for the price break.

By the way, the whole of China is basically shut down for two weeks. It's the Autumn harvest holidays. Don't be surprised if you can't reach anyone over there or if your shipment of whatever is late.

One thing you can't overlook, the radios are not in production.

I'm not sure if that much of a price break could be garnered if you bought
a 1000 at a time. $150 is just about retail for a Chinese dual
band HT. I'd hold off on the speculation for now until we
hear from Ed while he's in China or when he returns. Who knows
he might even pop in here while abroad with an update.

I confirmed again with my wholesaler. There trying to fix a issue with one of the chips. Did not go into detail. I have been dealing with this person for a few years. We talk on the phone. Thank God he has a good american act. Hate to break it to a lot of people but there might be some big markup on these once they hit the usa. I already paid for my shipment but they confirmed again the issue was still happening. So now who knows how long it will be.

Im sorry to break it to you but a person can order a item direct from a dealer in china or order like 5 or so. I can order 10- UV-5r's w/cables for 30usd shipped

newer Wouxun's are around 50 a peice per order of 5 or 10.

They can ship fast too, so when you order like 5 or so radios they will ship DHL Which it will arrive in 4 days.
Snail mail is fine as well. They will wrap 2 radios and twine and they come would come in about a week and a half.
Remember we are dealing with the china man. They will sell anything and never loose a sale. All you nay sayers about type fcc accepted. Thats for dealers not individuals. Extra Test. Exam question about buying a amplifier from another ham that transmits out of band. (As long as its from ham to ham) There are soo many loupoles

I hardly talk on vhf/uhf but I do talk to some friends on uhf and have a uv-5r with that big 3600mah battery. China knows what we want. I keep that radio on 24 and use it as a demo as well. Whenever they came out with it. about a year ago or so.

When the 588uv gets all there bugs out. Do you all realize the impact in the usa branded radios. My god... I have personally played with one and it does all the normal junk. My big thing is CBR Mode. Its chinese looking and cheaper plastic but who cares. as long as its stable and last.

Just saw this yahoo group. And wanted to speak the truth. You can verify everything im saying with a little digging..

I just emailed an American in Hong Kong. He will be meeting Ed Griffin from wouxun.us on Thursday. Ed has heard nothing regarding a chip problem but I expect to garner some more insight on this next weekend. As far as the $50 Wouxun goes, those are probably counterfeit. Unscrupulous Chinese vendors are supplying those without telling the buyer they are not a genuine Wouxun radio. So beware of this because Ed says you cannot tell the difference between the fake and real Wouxun.

Here is an email quote directly from AnyTone about my query to any problems they might be having with the radio.

"No, we have not met problems with AT588UV, now it is working smoothly. We have changed microphone design according to your comments, we add a speaker on front side of microphone."

So it seems comments about chip problems are false. The picture they sent of the microphone is a 3-D CAD (Solid Works)and is large and not in great detail, so I won't post it. It looked like they also added a switch below the up/down buttons, hopefully to disable all mic buttons.

Regards,
Ed Griffin

Has feedback been provided regarding a data port? 6 pin mini-DIN pin compatible with the Kenwood D710/V71 would be perfect.

Will CHIRP likely be able to support the AT-588UV for programming?

This is a suggestion I have made but have gotten no comment yet. The USB connection on the left side is actually no more than a charging voltage for cell phone type equipment. I suggested it would be more desirable to have this as a data port. I think I suggested they make it a second, parallel mic jack.

I've had some email QSO with Dale who lives in China for most of the year. He says that during the holidays China basically shuts down. He said rumors about the chip problem are false and the delay is in fact due to the holiday and the electronics convention. One thing I question is putting a speaker inside the microphone. I've never heard of such a thing for a mobile rig.

I've downloaded the factory software and have been exploring it. So far from looking at the interface I have no complaints. I have it installed on my windows partition of my MacBook running the windows 8 beta. I've been wondering about the CHIRP support because I am a Mac user and actually been using it a lot for programming my wouxun and baofeng ht's.

I've been waiting on one to permanently mount in my
suv since I traded my Icom 706 for an Alinco all mode
10-160 meter HF rig. The Icom was repaired twice for
the same thing so it was time to go. Had my Yaesu FT8900
in the suv but brought it in the shack so I had .70/2/6 FM
and all mode 10-160 meters. So the 588 will get permanent
mounting in my SUV. I just have to figure how to remote mount
the control head. Might try something with an old GPS suction
cup I have and rig some way to fasten the control head to it
without causing too much cosmetic damage to the control head.
Bummer there won't be a holder for the control head for a while
but I'm sure I can whip up something that won't look too tacky.

Depends on the room right?? The radio itself looks reasonably small might not have to so that. I'll see how it goes in my Charger, assuming it's not the dead of winter before the radio is available.

Personally, I just started to use Chirp because it is the only natively running programing software for the Mac OSX and it works on everything I own at this time. I alos. too. hope that Chirp gains support for the AT-588UV. Very nice in my honest opinion and I am so happy with it. My thanks to the makers and the people who keep it constantly updated.

That's why I'm waiting on this radio also, to mount in my SUV, I have been running a single band Kenwood in it but I am having to rework my whole setup so I figured why not go ahead for a dual-band. That way I can use the single band Kenwood as a emergency go-kit radio if needed.

Back to the discussion of MDC 1200, it is that data burst(skwawk) that you commonly hear when listening to public safety frequencies. It sends an identifier telling the dispatcher what radio is transmitting. Some of the other features that it gives are stun and kill of radios, also you can send out a signal to see if the radio is in range by whether it replies to a "ping" sent to it. Also you can remotely monitor radios with it so you can turn on the mike remotely to listen to what is going on around the radio. Also there is the emergency or "Man Down" function which sends an emergency tone and signal and can have various actions depending on how it was programmed. Alot of dispatch centers are now mandateing that it is used on radio transmitting on their channels, especially up here in New England.
I would love for one of these chinese radios to have MDC encode and decode as currently i can use them to monitor our dispatch channels, but due to them requiring it on all transmitting radios, i cant transmit. I think that if that feature was added to one of the radios, it would become a very big seller, especially to volunteer firefighters and other public safety users who are required to use it, and a cheaply priced radio would be very popular compared to the expensive ones out there now.
I for one, would be on the waiting list for at least 3 of them

I despise that squawk. In our conventional systems it only takes place after the radio being called replies be it base to mobile or mobile to base. Then it occurs at each unkey. I think they know it is annoying also and might persuade some not to monitor.

I also remember reading that some EDACS systems, maybe, Erricson had annoying tone bursts that were functional in the system but also very annoying to listen to. There is one analog EDACS system left in range here and I haven't heard those tones.

It also seems the MDT running on conventional systems is very flakey. Our PD uses something called Redhawk to do LEEDS and CJIS checks on the registered owner of the vehicle they run plates on to save chatter to dispatch. They can also forward message back and forth. Well that seems like a great idea if the system wouldn't lock up, go up and down, not send or forward messages most of the time.

The ones here are using a brand that will go off as they key up or as thy release the ptt button. We don't have the console programmed so it just shows the serial number of the radio anyway.

One list member here Ed Griffin is an importer and he has
had the AT588UV for a while. He's been critically involved in
feedback of design and operation. And I think he's on his way
to China today for the electronics convention and maybe to take
a trip to the Anytone factory.

New Wouxun KG-UV920R Mobile Dual Band Radio Is this email not displaying correctly?
View it in your browser.

Wouxun KG-UV920R Dual Band Mobile - After months of testing and completion of FCC certification, we are please to announced we have a shipment of the new Wouxun KG-UV920R mobile radios arriving this month.
This full feature dual band mobile will have included a separation kit, USB programming cable and software. All for a price under $300 !
Full details will be posted on our web site this Saturday, October 13th, at approximately 10 am (Eastern). We expect to sell out quickly and are giving our newsletter subscribers advanced notice. We appreciate your support.
The radio, including details, will be shown on our Wouxun page at:
http://www.cheapham.com/brands/Wouxun.html
Once on this page, click on the KG-UV920R for details. You will be able to pre-order to reserve your radio.

From: kingfish_stevens
Topic: 141 Message: 141

I had a nice long visit with AnyTone's head engineer today. A couple improvements are worth noting. The improved mic will have a small speaker added to its front. A switch to deactivate the mic's buttons will be added to the right side. The firmware will be able to be upgraded by the dealer but not by the owner.... at least that's how it stands now.

Full production will begin in November and samples will be available next week. I may get as many as 50 on this first run.

From China,
Ed Griffin

I tried really hard to NOT comment on this posting !

MORE channels ????
This radio already has 500 plus channels! (RTFM)
11 meters ???
Does this person have a clue what makes radio work ??

For 300 bux , what would you expect ?

I would like 6 meters also, but ???

11 METERS?!?! What does a "Ham" operator want with 11 meters?!?! This radio is meant for licensed Amateur Radio Operators ONLY! It's not like most licensed amateur radio operators want or need to have 11 meter C.B. and the transmitter in this radio is F.M. ONLY!!! In the 11 meter band in the U.S., F.M. isn't even an authorized mode!!!!

The radio will have AM aircraft receive. But as far as the receive being broad enough to tune 11 meters, that's not going to happen. And since the radio's emissions won't include AM that sort of makes it final. Also we're going to keep the chatter on mods down here. Unless the mod is FCC accepted then find another forum to discuss them in.

In my installations the transceiver body is often mounted under the passenger seat. This makes for muffled audio unless running external speaker.

The speakers in the mics are very good for neatly overcoming this issue.

I had a nice long visit with AnyTone's head engineer today. A couple improvements are worth noting. The improved mic will have a small speaker added to its front. A switch to deactivate the mic's buttons will be added to the right side. The firmware will be able to be upgraded by the dealer but not by the owner.... at least that's how it stands now.

Full production will begin in November and samples will be available next week. I may get as many as 50 on this first run.

Well guys I didn't mean to get feathers riffled.I work in very remote areas and have found at times when I get stuck or had a emergency the only help I found was from CBers that happen to be offroading in near by areas.A unit that is capable of multiband would make my life easier and safer.
As for the guy who asked do I have a clue,well yes I do.Your rude comment was uncalled for.Operators talk of how they are more proper,I guess you didn't get that memo did you? I asked my question respectfully,is it so hard to reply in the same manner?

I enjoyed your review. Hopefully the audio can be fixed before final release of the radios or in the firmware. Would you say that problem was a deal breaker or just slightly annoying?

I'm confused why people think a broadcast FM Radio is a must have feature over something like AM airband receive. Doesn't everyone already have an FM radio in their car and home?

That is true, but for at least me I would mount a full
size external communications speaker. My Alinco
DX-8SRT has its speaker mounted in the control head
so all you need is a CAT5 jumper and some kind of
home made mounting bracket and you're ready to go.

Someone claims this radio is "FCC Part 90 Certified", if
this the case,
with the software you can program it to whatever frequencies
you might be licensed
to operate on.
While no one said anything about part 95 (GMRS), most folks
think that if it is
Part 90 Certified, that it is "automatically" Part 95
Certified.
This has been a "sticking point" for a long time.
I don't know the answer to that question, but if I had a
GMRS license,
would I put in another radio in my truck ?
My point is, why talk about mods, when this radio is already
capable of such a wide range of frequencies ?

All good points. My point is modifications that make the radio
operate illegally according to FCC rules. I can't be informed
on other countries around the world where the radio might end
up but again there are international forums that deal specifically
with modifications. I'd just prefer not to get into that discussion
here and would hope everyone would respect how I feel.

Depends on how loud and clear the speaker mic is. The speaker
mic for my Yeasu FT60 ain't worth crap in my SUV unless I
hold it up to my ear. And my SUV is quiet inside. But I'll
have to admit that now I'm not perplexed about a stock speaker mic
remembering the control head is detachable. The ideal solution
would be what Alinco does with its DX-8SRT all mode 160 - 10
meter HF transceiver. The put the speaker in the control head.
And although it's small it is loud and easy to copy. Of course the control
head is much bigger on the Alinco than the Anytone, so building
a speaker into its control head would be a problem.

In my installations the transceiver body is often mounted under the passenger seat. This
makes for muffled audio unless running external speaker.

The speakers in the mics are very good for neatly overcoming this issue.

I'm still a little confused, or not clear I guess.
I get there will be a small speaker in the microphone, which will serve it's purpose nicely, if not always efficiently.
But will there not also still be a speaker mounted in the body of the radio as before?
And if this is the case, perhaps one will be able to use a menu setting to send audio from the left side, or right side, to the speaker in the radio or the speaker in the mic.
Perhaps there will only be a speaker in the mic which would be OK I guess, but a small speaker like that will be very difficult to hear with road noise.
Personally I always use a large communications speaker in my mobile installations regardless of the radio being installed...so it's not really a problem for me, but I'm kind of curious as to the logic behind this one.

I had a nice long visit with AnyTone's head engineer today. A couple improvements are worth noting. The improved mic will have a small speaker added to its front. A switch to

deactivate the mic's buttons will be added to the right side. The firmware will be able to be upgraded by the dealer but not by the owner.... at least that's how it stands now.

Full production will begin in November and samples will be available next week. I may get as many as 50 on this first run.

From China,
Ed Griffin

but obviously not scrapped before they shipped at least one order to cheapham...
I guess there will be some suckers out there and I'm sure we'll hear all kinds of complaining about it once a few of them have been bought.

The radio had terrible interference problems with the
receiver if I recall correctly and was scrapped by Wouxun.

New Wouxun KG-UV920R Mobile Dual Band Radio Is this email not displaying correctly?
View it in your browser.

Wouxun KG-UV920R Dual Band Mobile - After months of testing and completion of FCC certification, we are please to announced we have a shipment of the new Wouxun KG-UV920R mobile radios arriving this month.
This full feature dual band mobile will have included a separation kit, USB programming cable and software. All for a price under $300 !
Full details will be posted on our web site this Saturday, October 13th, at approximately 10 am (Eastern). We expect to sell out quickly and are giving our newsletter subscribers advanced notice. We appreciate your support.
The radio, including details, will be shown on our Wouxun page at:
http://www.cheapham.com/brands/Wouxun.html
Once on this page, click on the KG-UV920R for details. You will be able to pre-order to

reserve your radio.

THANK-YOU FOR SHOPPING AT CHEAPHAM.COM !

After much discussion the speaker mic primary function
will be for control head separation. The chassis mount
top mounted speaker will remain and some system will
be used to switch to the speaker mic when the control head
is separated. It could even be automatic. Or you could choose
to operate either or both at the same time. I'm hoping to get
one of these final release prototypes when Ed gets his first
shipment before the radio goes into full production next month.
It will help to answer some of these nagging questions.

□
I'm still a little confused, or not clear I
guess.
I get there will be a small speaker in the
microphone, which will serve it's purpose nicely, if not always
efficiently.
But will there not also still be a speaker mounted
in the body of the radio as before?
And if this is the case, perhaps one will be able
to use a menu setting to send audio from the left side, or right side, to the
speaker in the radio or the speaker in the mic.
Perhaps there will only be a speaker in the mic
which would be OK I guess, but a small speaker like that will be very difficult
to hear with road noise.
Personally I always use a large communications
speaker in my mobile installations regardless of the radio being installed...so
it's not really a problem for me, but I'm kind of curious as to the logic behind
this one.

You may be right about that, I don't know. I only deal with honorable people Ed Griffin from wouxun.us being one. He could have purchased some for sale but didn't. He's in China right now talking with Anytone and there for the electronics convention. I would have loved to have accompanied him and probably would have had I known about it more then a week or two prior.

I would rather see separate jacks for the left and right VFO's. From the manual it looks like the speaker jack is combined audio from both sides.

One jack is much standard among the dual band radios
I've owned and seen. What other radio do you know of
that has separate speaker jacks for each side of the radio?
And what purpose would it server?

My Icom IC-2710H has two speaker jacks. No speaker plugged in = both sides routed to the internal speaker. Plug into one jack, audio from one side is routed to the internal speaker while audio from the other side is routed to the external speaker. Plug into the other jack, audio from both sides is routed to the external speaker. Plug speakers into both jacks, audio is routed to separate external speakers which allows a person to position the speakers away from each other. Then it is possible to know which band is receiving simply by knowing which speaker you are hearing.

I knew there had to be a radio out there with a speaker
and jack setup like that but I've never seen one. None
of the dual band Yaesu radios I've owned had two speaker
jacks including the FT8900 quad band I currently own. But it
has separate audio amplifier for an external speaker. More audio
watts I reckon. If you find it useful to have a separate jack for
the right and left sides of the radio so be it. With the AT588UV
they are trying to keep the performance high and the price low.
So naturally there will be a few convenience features missing.

no, from the manual, it looks like VHF only is sent to the external speaker, and it is not combined audio from both bands to the ext speaker.
Other major manufacturers have been known to do this, so it's not just another chinese radio quirk.

all of the current dual banders on the market have separate output jacks...except for some of the new yaesus which use a stereo jack and a splitter for left and right VFO's.
It's extremely common to have two audio out jacks.

One jack is much standard among the dual band radios
I've owned and seen. What other radio do you know of
that has separate speaker jacks for each side of the radio?
And what purpose would it server?

I would rather see separate jacks for the left and right VFO's. From the manual it looks like the speaker jack is combined audio from both sides.

They refer on page 28 of the manual to the UHF and VHF
audio signals at "tracks" oddly enough. Must be translation
problems. And they do refer to the speaker jack as the VHF
External Port. In the set menu #52 you can set up either
INT for both UHF and VHF on the internal speaker or EXT
for VHF only out the external port. Now since this manual was
written, they may have made some changes to this. Personally
I would want both bands to be able to use an external speaker.
If the radio is loud enough on the internal speaker then it wouldn't
make a difference to me.

no, from the manual, it looks like VHF only is sent
to the external speaker, and it is not combined audio from both bands to the ext
speaker.
Other major manufacturers have been known to do
this, so it's not just another chinese radio quirk.

My FT8900 has a stereo jack but only to sense the external speaker
is plugged in. It shorts a diode and shuts off the internal speaker amp
if the audio path setting is left at default. There is a volume IC shown
on the schematic that takes audio from both side A and B sends the audio
to drivers for the internal and external speaker amps. A and B audios
are combined after the drivers and then fed to the output chips. So there
is just one audio feed to the external jack. I'd love to have a schematic
of the AT588UV to see how they are routing audio through the unit.

The current crop of Kenwood dual banders have two external speaker jacks, one for each receiver.

I owned an 8100 but don't remember it having an audio
jack per side. Or did it actually have a jack per band?

Would be a little hard on my 8900 quad band to have
a jack for each band and 4 external speakers :).

I guess it's a convenience issue of a personal note.
Some like me prefer one external for both sides
some like two. But that wouldn't be a feature that
would make me choose one radio over another. Especially
if the radio was a solid performer and around $275.00.

I have an 8100 in the mobile right now...it has two speaker jacks, one for each side of the radio...which is also the same as for each band on that radio since the left side is VHF, and the right side is UHF.
However, if you plug a speaker into the inside jack, the one closest to the fan, you get both sides of the radio out of the ext speaker.
great little mobile...it's just too bad the separation cable connecters are so odd ball...makes finding one very difficult.

Been over a decade since I owned the 8100 but I still have the
bracket to mount the remote head in! Did not the extension cord
for the remote head connection terminate on each end with a
mini 6 pin DIN connector? If so that's pretty common to find
with many other types of equipment.

On a separate note, sporadic E skip has been amazing on 10 meters
tonight.

yep, hearing most of south America and Australia from ve6 land as late as 6PM tonight on 10M.
Good signals as well...the band has been dead for a couple weeks after the initial excellent conditions earlier in the fall.
The connector for the 8100 is a flat rectangular 6 pin connector with a screw that holds it in...if that makes any sense. The contacts are on the flat side of the connector, so I don't think it could be called a din connector.
Apparently the separation cable for the ft100 will also fit the 8100...but those are nearly impossible to find as well.
I haven't looked really hard at local connector supply places though, so perhaps I could find a set that will work and make up a nice cable with some shielded CAT5.
total cost probably 15 bucks...compared to the 60 or 70 yaesu charged for it hi.

anyway, looks like the at588UV will be using the standardized RJ45 style connectors like most of the newer mobiles.
A trip to any big box store will get you as much of that as you could want for next to nothing.

Been over a decade since I owned the 8100 but I still have the bracket to mount the remote head in! Did not the extension cord for the remote head connection terminate on each end with a mini 6 pin DIN connector? If so that's pretty common to find with many other types of equipment.

On a separate note, sporadic E skip has been amazing on 10 meters tonight.

I have an 8100 in the mobile right now...it has two speaker jacks, one for each side of the radio...which is also the same as for each band on that radio since the left side is VHF, and the right side is UHF.
However, if you plug a speaker into the inside jack, the one closest to the fan, you get both sides of the radio out of the

ext speaker.
great little mobile...it's just too bad the separation cable connecters are so odd ball...makes finding one very difficult.

I owned an 8100 but don't remember it having an audio
jack per side. Or did it actually have a jack per band?

Would be a little hard on my 8900 quad band to have
a jack for each band and 4 external speakers :).

I guess it's a convenience issue of a personal note.
Some like me prefer one external for both sides
some like two. But that wouldn't be a feature that
would make me choose one radio over another. Especially
if the radio was a solid performer and around $275.00.

My Yaesu FT8100's, Kenwood D700 and the Kenwood TM-V708 all have separate jacks. I am able to mount the speakers far enough away that I can hear what radio and what band the audio is from.

From what I can see from the only real pic I have seen
as well as what I have read in the manual, the part that
comes off the radio
doesn't seem to have the mic connector, which would mean
that you might
also need to extend the mic cable...?
I "thought" I had seen a real photo radio with the "control
head" (front panel)
removed, but I have been looking at so many radios lately
I'm not sure what I have really seen ;-)
There has been a lot of talk about the 8100, seems to me
that the "kit" included three cables ?
Control, mic and power but not sure.
What does anyone know about the AT-8-588 U, uhf only radio ??

the at588uv that we are all eagerly awaiting does have the mic connecter on the control head.
At least, the manual that Ed sent out a while back indicated such...the final product is obviously still going through some changes, so who knows.
The 8100 control head has the mic connector on it, so I don't think the original separation kit would have had a mic extension cable.

I have a 588uv in front of me and the mic connects to the head.

Also the extension for the head is a simple straight thru cat5/rj45 unlike
the Wouxun 920r that has a special pinout.

ok, so the manual is correct...I can't see them changing something like that on the final release of the radio. Thanks for the clarification.

yep, hearing most of south America and Australia from ve6 land as late as 6PM tonight on 10M.
Good signals as well...the band has been dead for a couple weeks after the initial excellent conditions earlier in the fall.
The connector for the 8100 is a flat rectangular 6 pin connector with a screw that holds it in...if that makes any sense. The contacts are on the flat side of the connector, so I don't think it could be called a din connector.
Apparently the separation cable for the ft100 will also fit the 8100...but those are nearly impossible to find as well.
I haven't looked really hard at local connector supply places though, so perhaps I could find a set that will work and make up a nice cable with some shielded CAT5.
total cost probably 15 bucks...compared to the 60 or 70 yaesu charged for it hi.

anyway, looks like the at588UV will be using the standardized RJ45 style connectors like most of the newer mobiles.
A trip to any big box store will get you as much of that as you could want for next to nothing.

Been over a decade since I owned the 8100 but I still have the
bracket to mount the remote head in! Did not the extension cord
for the remote head connection terminate on each end with a
mini 6 pin DIN connector? If so that's pretty common to find
with many other types of equipment.

On a separate note, sporadic E skip has been amazing on 10 meters
tonight.

I have an 8100 in the mobile right now...it has two speaker jacks, one for each side of the radio...which is also the same as for each band on that radio since the left side is VHF, and the right side is UHF.
However, if you plug a speaker into the inside jack, the one closest to the fan, you get both sides of the radio out of the ext speaker.
great little mobile...it's just too bad the separation cable connecters are so odd ball...makes finding one very difficult.

I owned an 8100 but don't remember it having an audio
jack per side. Or did it actually have a jack per band?

Would be a little hard on my 8900 quad band to have
a jack for each band and 4 external speakers :).

I guess it's a convenience issue of a personal note.
Some like me prefer one external for both sides
some like two. But that wouldn't be a feature that
would make me choose one radio over another. Especially
if the radio was a solid performer and around $275.00.

My Yaesu FT8100's, Kenwood D700 and the Kenwood TM-V708 all have separate jacks. I am able to mount the speakers far enough away that I can hear what radio and what band the audio is from.

Yes I believe the jacks on the 588 will accept an 8P8C plug. But you'll be better off just buying a CAT5 jumper unless you have the right stripper and crimper and cable. Back in my IT days just as ethernet was starting to replace coaxial networking I used to make my own cables because ready made cables were expensive. So I bought the tools, CAT5 cable and 8P8C connectors. The cable had to be stranded because solid copper while perfect for cable drops would always get nicked just enough by the stripper to eventually break when moved around.

Hello

I am dealing with someone named Ken at anytone. Can someone confirm for me the real Anytone AT-588UV manufacturers website? Also the want payment by western union. Is this normal or am I being led astray here. I really need to make sure my money is not being sent into a vacuum, and that I am dealing with real Anytone salesperson.
Thanks,

Shane

You'd be much better off buying a radio from a US
vendor once the radios go into production. What you
would possibly be buying is a prototype if you are buying
from China. Also a money order transaction sounds
fishy to me so caveat emptor.

If the radio proves to be a good performer, There will
be half a dozen or more importers. Ed Griffin from
wouxun.us is a list member here and would be an excellent
choice to purchase your radio from. I ordered a Wouxun KGUV6D
hand held from him on a Saturday and the radio was here Tuesday.
And I'm several hundred miles from his business.

How many actually have a radio? You, Ed Griffin are the only two I know. Since production doesn't start for another 3 weeks or so you might have a prototype depending on the serial number and age. I would expect a bug like that in a prototype radio. Unfortunately I think I heard that the firmware won't be able to be updated by the end user. Good luck, hopefully there will be a solution.

I'm still in China....

Writing to memory worked fine with the second radio I had... I didn't try it with the first one. I have a third sample that they gave me during this visit, but I've not used it yet.

I did post earlier that their engineer said dealers would be able to update firmware. This would be done with a piece of hardware/firmware that would cost the dealer about $300. Maybe not the best situation, but better than we've had in the past.

By the end of this month, I will have these radios. How many, I don't know. I told them I'd take all they wanted to make on the first run. Could be 100, or more.

At last info, the first run would come with the original mic. The improved mic with speaker and locking switch would be produced after the original stock was used. I will supply the improved mic to my customers at costs when they become available.

I'll be back in the US in a few days and maybe we can get ths ball rolling. By the way, several dual band mobiles are being released, but the Anytone is far and away the best I've seen so far.

That feature sounds really good. I wonder how long is going to take for the FCC to certify the radio. I want one.

There seems to be a copy of the programing software on line
do we know if the programing cable will be available, at
what price?
or a circuit for it, so one could be built ??

From what I recall cloning will be done with a
cable using modular type plugs (8P8C) on possibly
a CAT5 ethernet cable plugged into the mic jacks of both
radios. Really all that would be needed is a USB to serial
data converter sold for a lot of other radios, the pinout of
the data I/O and a proper home made adaptor to take data
from say a 3.5mm style RTS plug and put the data on the
right pins for the Anytone cable.

However until I actually have one of these in my hands, the
production model and not a prototype, I won't be able to say
for absolute sure and that something may have been changed since
my investigation. I'm hoping to have a radio by the end of this
month so I'll be able to give a better assessment of its operation
and capabilities because of right now it's little better than speculation.

Cloning assumes that you have two radios,
If you have a programing cable (with the software, of course)
you can write the same file to as many radios as you want.
That's why I see little use for a "cloning cable"
The software looks "interesting" if I'm looking at the
correct software.

Writing to and from the computer is cloning as
far as the radio is concerned. That's why I referred
to the process as cloning. I gave you some ideas
on using a data cable from another brand radio
and making an adaptor all in the spirit of amateur
radio. And that was the point I was trying to make.
Most of these radios use the same serial data for
programming. Some may require different parameters
for the UART output like baud rate, stop bit, parity etc...
So it may not be as simple as making an adaptor.
So try to be patient and hold off on the programming
questions until someone on the list can get the finished
product radio and do some experimenting.

at this point, we're hearing early to mid november...that is when the first shipments will be shipped...probably another couple weeks after that before they are actually shipped to customers.
I'm going to say late November to early December before they are readily availible to customers.
naturally, this all revolves around how quickly the manufacturer can get the first run ready to go and shipped out to the vendors.
It's like this, they'll be ready when they are ready, and you'll be able to buy one when they appear for sale on the vendors websites hi hi.

Wasn't reverse-burst used when PL (or QC) used mechanical reeds,
What the "reverse-burst" actually did was send a "burst" of
the same tone
180 degrees out of phase which would "stop" the reed, which
squelched
the radio before the carrier was turned off a half second later.
I'm not even sure it's even used anymore

Reverse burst is done digitally now in most repeaters, and I think it is in most commercial radios as well...STE is a different thing, though it has more or less the same effect as reverse burst.
STE uses a slight rx hang time to prevent the user from hearing a squelch burst when they unkey their transmitter.
Reverse burst deals more with the squelch burst often heard when the repeater tail drops...as aposed to when you actually unkey like STE.
Funny you should mention reeds...I havent' been around radio long enough to have known about or used reed type tone modules...but some of the older guys were talking about it the other day... Pretty neat how the big M utilized that...and of course, that is why we have all these odd ball tones now as standard because of the fact that reeds couldn't be designed to produce exact even frequencies all the time.
If ctcss tones had been developed in the digital age, they would all likely be even multiples instead of these odd ball tone frequencies we still use.

I never thought about reed design problems, I always
thought the
"strange" tone freqs. were to avoid harmonic relationships.
Like in the telephone industry, test tones are just off the
"even numbers"
like what most people as 1000 Htz is really 1004.

I don't see anything about Reverse Burst (MOT) or STE (GE)
PL crowbar in the user manual. There are a couple extra squelch
setting that allow PL plus or with optional signaling but the manual doesn't
go into detail what that's all about.

The radio does have an adjustable tone burst of
1000 hz, 1450 hz, 1750 hz, and 2100 hz. to start
repeaters requiring a tone of one of those four frequencies.

Does this radio have the connection beep when you press the ptt and you hit the repeater. You get a beep back to talk. Like the Motorolas and icoms. I have a UV-5R too for the fire dept and can't figure it out. My UV-5R works on the system better than the icoms but with out the beep. As for the UV-5R please send me a link so I can find my answer on that. I don't want to change the topic.

Thanks.

Sorry I couldn't be more specific. There are a couple
list members that use different importers than I, maybe
they can give you a date when the final product hits
the US shelves. Myself I'm not in a hurry. I want the
radio to be bug free and a solid performer when I
power mine up for the first time. And seeing this might
be Anytone's first venture into a sophisticated dual band rig
I'm certain they won't be rushing anything unless they
want to end up like Wouxun's disappointing dual band
mobile rig. A lot of us had high hopes for that rig, glad
I was in no rush to buy one but I don't think any of the
finished product ever made it here.

that could have been part of the reason as well...
but even with .8 or .5 or .3 frequencies, you still get harmonics, just not on primary multiples of the frequency I guess.
So, 114.8 will still have a harmonic at 229.6 etc...
If they were worried about harmonics, they only needed to insure there weren't other tone frequencies at the harmonic frequencies...
I think the physical and mechanical design of the reeds prevented precise calibration to exact frequencies...so they allowed for a certain tolerance of error...IE 114.8 could probably accept frequencies .2 above or below...I don't know though.
There is probably a great wikipedia article that outlines all this in a more scientific way hi.

I never thought about reed design problems, I always thought the
"strange" tone freqs. were to avoid harmonic relationships.
Like in the telephone industry, test tones are just off the "even numbers"
like what most people as 1000 Htz is really 1004.

On 10/21/2012 5:56 AM, Colin McDonald wrote:

Reverse burst is done digitally now in most repeaters, and I think it is in most commercial radios as well...STE is a different thing, though it has more or less the same effect as reverse burst.
STE uses a slight rx hang time to prevent the user from hearing a squelch burst when they unkey their transmitter.
Reverse burst deals more with the squelch burst often heard when the repeater tail drops...as aposed to when you actually unkey like STE.
Funny you should mention reeds...I havent' been around radio long enough to have known about or used reed type tone modules...but some of the older guys were talking about it the other day... Pretty neat how the big M utilized that...and of course, that is why we have all these odd ball tones now as standard because of the fact that reeds couldn't be designed to produce exact even frequencies all the time.
If ctcss tones had been developed in the digital age, they would all likely be even multiples instead of these odd ball tone frequencies we still use.

Wasn't reverse-burst used when PL (or QC) used mechanical reeds,
What the "reverse-burst" actually did was send a "burst" of the same tone
180 degrees out of phase which would "stop" the reed, which squelched
the radio before the carrier was turned off a half second later.
I'm not even sure it's even used anymore

oh come on, what are you saying? tubes were drifty, unstable and often varied greatly within the specified rating of error? lol
They still function fantastically in certain applications, but you are right, stability in sensative RF frequency circuits is not one of those applications hi.
Unless of course you are a ham and don't mind adjusting knobs and dials constantly to maintain correct frequency...

Colin, tubes were in land mobile back when Motorola developed Private Line. The user had no control to tweak his or her radio so tolerances were usually wide and this stuff came to use in the early 60's. I remember the old MOT land mobile stuff using a dial instead of push button and a combination of push buttons to get you into the repeaters in your area. It's all good memories for me well before my ticket came in 1991. And I currently use tube equipment. Also repair it.

yep. The oldest Motorola radio I've seen is a mocom 70...and as late as 1994, they could still be found in some of the logging trucks my dad used to drive when I was a kid.
A huge suitcase sized unit under the seat or bolted to the back wall of the cab, and a little control head with a 4 position channel knob, a volume and squelch control.
They were obviously built like tanks if they were still in common use in the mid '90's, and in rough old logging trucks at that lol.

There are still mocom 70's in service, at least until the end of the year.
There may still be Motrac's (transistorized with tube final(s)) and
Motran's (all transistorized)
someplace, because they were all more or less "bullet proof".

Used to operate a Motrac on 6 meters. What a boat anchor!
Still have a complete Mocom brick, head, mic and speaker
but not crystal'd for 2 meters. Had a GE Mastr II UHF
brick but sold it and helped another ham set it up for .70
repeater. He's been using it for 15 years now. I still look
for the old MTS stuff when I go to ham fests.

There are still mocom 70's in service, at least until the end of the year.
There may still be Motrac's (transistorized with tube final(s)) and
Motran's (all transistorized)
someplace, because they were all more or less "bullet proof".

Been 15+ years since I've converted a Mastr/Master for
amateur use but these two didn't use a TCXO (that
I can remember until they got up into 800 mhz.)

Jan and International should still be
able to make these at a decent price I would think.

I think crystals were about 40 bucks a piece at the time...and you need two if using a repeater pair...so 80 bucks a channel...when the radios were free I figured $80 each for one channel was a bit more than I cared to spend :)
Obviously if being used for a repeater it would be pretty reasonable, but I wasn't and it was for ham use, so being a ham, I'm cheap, and can't justify spending that kind of money for a single channel radio hi.
I'd much rather drop 80, or significantly less these days, on a GM300 and put a couple back to back for a repeater.

From: John
Topic: 56 Message: 237

None of my commercial radios specifically call out reverse-burst/ste in the manual but some radio have a software setting with choices for the phase shift of +120, -120 or 180 degrees.

For those unfamiliar with the function, the radio shifts the phase of the transmitted ctcss approximately 150mS before dropping the transmitter. When the receiver detects the phase shift, it mutes the receiver immediately (for kenwood this default mute is 160mS) so you don't hear the carrier drop and resulting noise burst. Motorola and Kenwood (of which I have the most experience) use different values for the phase shift so systems using mixed radios have variable success with muting properly.

Tait implements it the "kill the ctcss then drop the carrier 200mS later"method which is what I implemented on some ham systems. (Until I told them M and Kenwood do it so a software update fixed that problem)

This feature is especially useful when using earphones. When someone quits talking, the radio goes quiet without blowing a noise burst in your ear.

One repeater I use frequently, only transmits tone
when its receiver is open. So if you use tone encoding
you don't hear any tail, ID, or on the hour time announcements.
Wish more would adopt this practice along with our local
conventional law enforcement repeater. They use those 1200
baud bursts after they unkey and it makes it very unpleasant
to listen to. Of course they know that :)

None of my commercial radios specifically call out reverse-burst/ste in the manual but some radio have a software setting with choices for the phase shift of +120, -120 or 180 degrees.

For those unfamiliar with the function, the radio shifts the phase of the transmitted ctcss approximately 150mS before dropping the transmitter. When the receiver detects the phase shift, it mutes the receiver immediately (for kenwood this default mute is 160mS) so you don't hear the carrier drop and resulting noise burst. Motorola and Kenwood (of which I have the most experience) use different values for the phase shift so systems using mixed radios have variable success with muting properly.

Tait implements it the "kill the ctcss then drop the carrier 200mS later"method which is what I implemented on some ham systems. (Until I told them M and Kenwood do it so a software update fixed that problem)

This feature is especially useful when using earphones. When someone quits talking, the radio goes quiet without blowing a noise burst in your ear.

73,

John, KK6DJ

I looked thru all the menus and both versions of the manual I have and it mentioned nothing about that.

DO you know what else it might be called

Can anyone confirm whether reverse-burst/squelch-tail-elimination, is implemented?

do modular connections take a RJ11 or RJ45 ?

Yes both are modular connectors. The RJ11
aka 6P6C (six position, six connection)
for multi-line POTS (plain old telephone)
or RJ45 aka 8P8C for ethernet. I suspect it
will be the RJ45 on the final iteration of the radio
since the upgraded microphone will be a speaker
mic.

Yeah we're all itching for them to go on sale here
in the US but I'll wait out any delays. I have other
dual banders and a quad band so there is no rush
to trade haste for quality.
I like to use the quad band at home for 50 watts
on 6 meters. Don't need that in the SUV so the 588UV
will be a permanent mount. And you can bet the
farm I will take whatever time I need to understand
that radio and the programming software 100%.
This place is going to get pretty busy once the radios
start circulating.

Used to operate a Motrac on 6 meters. What a boat anchor!
Still have a complete Mocom brick, head, mic and speaker
but not crystal'd for 2 meters. Had a GE Mastr II UHF
brick but sold it and helped another ham set it up for .70
repeater. He's been using it for 15 years now. I still look
for the old MTS stuff when I go to ham fests.

There are still mocom 70's in service, at least until the end of the year.
There may still be Motrac's (transistorized with tube final(s)) and
Motran's (all transistorized)
someplace, because they were all more or less "bullet proof".

248. New poll for Anytone_AT-588UV

Yahoo group: Anytone_AT-588UV
Date: 2012-10-24 04:41:02 UTC
From: Anytone_AT-588UV@yahoogroups.com
Topic: 248 Message: 248

Enter your vote today! A new poll has been created for the
Anytone_AT-588UV group:

Anytone has asked if VOX should be added to the AT-588UV. In my opinion it's not needed.
But I thought before I reply to them, I'd get the feelings of those on this group.
Regards,
Ed Griffin
www.AT-588UV.com

o NO
o YES

I voted.
It's a more or less useless feature on an FM radio.
they should forget about vox and implement voice prompts instead.

I agree that VOX is useless if you're hand-holding the unit. It can be useful when controlling it with a computer.

The topic needs to be included in the "New Poll" announcement Subject line to avoid confusion. We have two polls going with the same subject.

Since my and most votes are for: "I'll wait on more info from those who own the finished product."

The manufacturer should sell the first units to members of this group at half price as long as we publish a review.

Topic: 256 Message: 258

I always email the list member and advise them
their Yahoo account may have been compromised.
And to change their password. Yahoo groups
has it's own spam filter and this week caught
one spam message. I emailed the user and he replied
that his account had been acting strange and changed
his password. So unless Yahoo catches the spam
first, there isn't a way I've found to filter it the first time.
 that I'm currently aware of. If I see a second spam from a list member
I go ahead and set that user's status so their posts need
approval from me. If they don't do anything and I get
a 3rd spam from them then I remove them from the list.
So the list is being taken care of as well as it can be.

Milton,

list owner.

260. Cross-Band Repeat?

Yahoo group: Anytone_AT-588UV
Date: 2012-10-27 20:44:41 UTC
From: kd4e2001
Topic: 260 Message: 260

Is this rig supposed to do cross-band repeat?

How robust are the finals and how substantial is the heat-sinking?

If they skimp on either heavy cross-band repeat activity could result in premature failure.

I have an Alinco DR-605TQ which does cross-band repeat but it's a little deaf on receive (trying to troubleshoot that).

Thanks! & 73, David KD4E

If you look at the radio the heat sink looks very
robust. And yes the radio is advertised as true
dual rx and x-band capable. However with any
x-band repeater you are doubling the duty cycle
and it's recommended that you only use as much
power as needed. As far as your Alinco goes there
may be some desensitizing of the rx by the outgoing
tx. It may perk up if you choose another freuency
pair. I notice it also on on my Yaesu FT8900. With a
dual band AR270B 30 feet above ground near the house
I still have to run 5 watts on my HT to have 100% copy
of my HT on the receiving end. Standing wave is 1.2:1
and I'm using about 75 feet of Belden 9913 for the feedline.
So it's got to be desense but I haven't tried switching
freq pairs yet like I was told to do. It's not been an issue
for me.

Milton,

OK re. robust heat sink, and idea as to the finals?

When in Texas recently a friend put the rig on his
bench, with a real good test gear, and said the sensitivity
is 25uV - should be .5

I was hoping for a dirty relay but I think the relay
is sealed in that rig.

I am guessing it is a bad stage in the rx front end.

Haven't had the time to dig into the service docs to
ID the rx chain location so I can spot where the rx signal
dies.

I've been trying to find a local Ham, here in SE-GA,
with a good bench & skills to walk thru it with me.

Don't know what final it will use. But a good guess would
be a Toshiba of maybe a Mitsubishi RD70HVF1 power mosfet.
Your Alinco's sensitivity for 12db SINAD should be around 0.2
microvolts. So yes it seems its ears are weak. With the proper
tools like an Aeroflex Marconi test set it's shouldn't be difficult
to track down the culprit stage if you have service literature with
the signal values per stage. I don't have one but have access to one
a Marconi 2955 which is more than adequate. Good luck.

Although this may seem like a strange question, but what would you use "cross band repeat" for ?
I have been a ham for 50 years and haven't found but one or two times where "cross band repeat" was useful, and I'm not sure it was legal. (I did it anyway)
This is not a radio I would put at a remote location and leave it "cross band repeating".
and I don't think that was what the "cross band repeat" is intended for.
can someone give me an example of what you might use "cross band repeat" for ?

thanks

We have a very deep and narrow canyon nearby that precludes use of local repeaters from the bottom of the canyon. An XBand repeater could be located on a bridge over looking the canyon thus bridging the gap between the canyon floor and local repeaters. This is primarily a SAR use although it could also be used for hikers, fishermen, and river runners.

In Maine we use them in RACES (e.g. search and rescue or fires) where we have people in the field with HTs and no reachable fixed repeater. The ones we use are in a battery box with battery and radio so we can set them on a convenient hilltop. We mainly use ham bands but there are some public safety repeaters. The PS ones are made from two commercial mobile radios as there are (currently) no dual bander Part 90 rigs. This is one reason the Anytone is of interest.

Needless to say, these are for temporary use only and where a regular repeater is not available.

Don,

Here's a short list of situations where cross-band repeat is
extremely valuable:

1. In a big-box store where the steel shell is an RF-cage, 440 gets
out better & the cross-band repeat mobile in your vehicle
takes care of interfacing that to the local 2m repeater.

2. Emergency centers which often have areas that block 2m signals -
walking around using 440 with a 2/440 antenna on the roof
and a 2/440 cross-band repeat rig inside makes for better
flexibility. (We experienced this need first-hand in Florida
where the Red Cross was in another building and communicating
with them via any other means was nearly impossible.)

3. My home, and many others from what I hear and read, is made of
steel (roof, exterior walls, and studs). Cross-band repeat
allows me to stay on a Net (using 440 to a 2m repeater)
whether inside or out.

Others may have additional scenarios.

HTH ... 73, KD4E

During the summer I participate in Skywarn. I can't limit my
eyes to a desk with a vhf radio and my HT wont reach the
Skywarn repeater reliably. So I'm free to go outside and monitor
the weather and still communicate with net control or serve
as net control if I didn't want to jump in my mobile and go out
and spot where I have no problems getting into the repeater.

Another scenario might be a disabled person or an elderly person
with a lack of mobility living with a relative who also is a ham.
Same deal, the HT might not reach his or her favorite repeater well
so you set up a crossband repeater if the person has trouble getting
around to the radio shack.

Then there is an issue with legality. You need a CWID that will ID the
the radio's output back to the mobile users unless that user is the owner
of the radio station. Some radios have that feature built in, don't ask
which ones I don't know which. My Yaesu FT8900 does not ID on
crossband. That would make it illegal to operate for anyone besides the
station owner/operator. At least that's my take.

Although this may seem like a strange question, but what would you use
"cross band repeat" for ?
I have been a ham for 50 years and haven't found but one or two times where
"cross band repeat" was useful, and I'm not sure it was legal. (I did
it anyway)
This is not a radio I would put at a remote location and leave it "cross
band repeating".
and I don't think that was what the "cross band repeat" is intended for.
can someone give me an example of what you might use "cross band repeat"
for ?

thanks

Don, K8ZGW

I guess I'm just spoiled, from my basement with a handheld, I can get into about 4 2M repeaters and 5 or 6 440 repeaters. We do have a situation where our 6 Meter skywarn "backbone" system (which covers almost 1/3 of Ohio) is LINKED to a 440 repeater, which I can get into from my living room. I guess that's "cross band". ;-)

Thanks

Don

Don,

You sure are spoiled!

And your basement is at 500 feet above sea level with casement
windows?

I'm a member of a local Community Emergency Response Team (CERT) that uses a Kenwood TM-D710A dual-band mobile transceiver configured as a cross-band repeater. It allows our SAR teams with 5W (or less) HT's to communicate with each other and with the Incident Command post (over a distance of several miles) rather than tying up the local repeater and also to communicate with the local repeater and/or Skywarn repeater when they're unable to do so directly due to topography. For added distance / coverage as a cross-band repeater, we can locate and connect the Kenwood to dual-band antennas mounted on several of our town's fire stations.

If the AT-588UV proves to be capable (duty-cycle) of operating in cross-band repeater mode, it could allow us to add a lower-cost 2nd unit to expand our coverage in emergencies (such as Hurricane Sandy which has fortunately for us stayed to the east of us so far!).

From: kingfish_stevens
Topic: 274 Message: 274

Availability of AT-588UV

Here is the latest production information for this radio. Anytone will product a test run of 50 radios this week. I will receive a large number of these and will offer them for sale. Those that have requested notification on my web site will receive details by email.

A few of these first units have been promised to some of my dealers. The others will be offered for sale via my web site. First come first served.

Anytone has sought FCC certification for this model and is waiting for approval. These first 50 sold will NOT have the FCC certification sticker. The sticker will be provided after the sale. The first 50 sold will have the original microphone. The improved microphone, with built-in speaker will come with later production. I will furnish the improved microphone to the first customers, either free or at my costs.

Full production of this radio is scheduled for Nov 20. I will take pre-production orders right away, for delivery about Dec 1.

To receive information by email when all this is available, (plus prices, shipping, schedule, etc.) please click the "Request re-stock notice?" button on this web page....
http://www.wouxun.us/item.php?item_id=294&category_id=64
If your name is already on this list, you do not need to enter it again.

Any idea if va3isp's concerns were addressed?

http://va3isp.com/final-thoughts-on-the-588uv-pre-release-version/

RX audio is terrible. Constant static in the background even with transmitter in close proximity.

Front end of radio is wide open like a barn door. I hear pager blasts from almost 1Mhz up the dial.

Cannot store PL/CTCSS tones into memory from front panel.

TX audio has an AGC problem. Audio volume goes up and down/

No remote head bracket. It wasn't even in the making when I first spoke to them. They are now adding a bracket so you can remotely mount the head. (What's the use of a detachable face . it's not a car stereo)

Beep when setting options is obnoxiously loud. Doesn't seem to be controllable with volume.

Well I can tell you that all these issues were raised and most of them were already known.

The others were noted and fixed to the best of my knowledge. I did speak with Anytone directly last week and they were working on the last issue (Beep is really loud J)

Well I just got my 920R-A from Wouxun today and I can tell you that they definitely fixed all the issues in the first release.

I haven't used it mobile but the audio is much crisper and cleaner than the first version.

Depends.

At the moment it’s not a fair comparison. I have the new 920Ra and it’s fantastic. Hands down I’d go with that. BUT I don’t have a second generation 588 to compare it to so it’s tough.

If I had to compare the 1st gen head to head I’d go with the 920R. The audio and intermod issues that I got with the 588 was something that I just couldn’t get over.

Well I just got my 920R-A from Wouxun today and I can tell you that they definitely fixed all the issues in the first release.

I haven’t used it mobile but the audio is much crisper and cleaner than the first version.

Quick correction to this message.... The first test run of radios WILL have the improved microphone with the built in speaker.

I truncated your reply for brevity not to take it out of context. And as far as I'm concerned it's not fair to offer any advice on choices before the final product is on the market and we start getting feedback. If it's a dud, then it's a dud. Until then if you're asked to choose between the radios then take your answer to email or start your own 920R Yahoo group.

287. Remote mounting

Yahoo group: Anytone_AT-588UV
Date: 2012-11-04 20:04:39 UTC
From: ai8o
Topic: 287 Message: 287

I recently sold my pick-up truck, and bought a replacement truck.

Instead of putting my old TMG707A into my new truck, I am considering getting a 588UV.

I will remote mount the control head on the ceiling, and put the main unit on the back wall behind the seat.

A microphone and cord dangling from a control head on the ceiling is unacceptable.

I have looked at the Wouxun.us website, and have several questions:

1) is a remote mounting bracket for the control head available?
2) is a remote mounting cable set available, or can it be fabricated from CAT-5 cable?
3) does the microphone plug into the control head or into the main unit?
4) is a microphone cable extension cord required or can it be fabricated from CAT-5 cable?

The main unit will be on the back wall behind the seat,and the power cable will probably have to be extended.
5)What kind of connector is the stock power cord?
6) how long is the stock power cord?

5) costs of 1/2/3?

1) Won't know about the bracket probably until the radio itself is available.
2) CAT5 works fine for remote mounting. I'll assume it uses 8P8C modular connectors.
3) Mic plugs into the control head and will have a built in speaker
4) The mic cable can be fabricated. It will probably use 8P8C modular connecters, same as an ethernet cable.
5) The power cord will likely be hard wired to the unit
6) Not sure how long the power cord is but not likely long enough to reach your battery.

Not sure about the costs, you can price the CAT5 jumpers yourself, and for the mic extension
you'll need a female to female 8P8C connector. Don't know what gauge wire the radio uses but that's not too hard to discover and price when you get the radio. Autozone has spools of primary low voltage wiring.
You'll need two fuse holders with 30 amp fuses at the battery to protect the power cord.

Let me make one correction. Although the power cord will
likely be hard wired into the radio there should be a modular
type coupler between the fuses and the radio. A spade/blade
type with the female on the radio side.

Here are the radio's stock operating range

```
RX: 118~174MHZ(AM/FM)   TX: 136~174MHZ
       220~260MHZ                      400~490MHZ
       350~399.995MHZ
       400-490 MHZ
       49-870 MHZ(Optional)
```

OK, first of all if the coverage starts at 220 mhz you won't be able to receive 216 - 217. As far as rx/tx in business bands, according to the above specs some of those bands are covered. Keep in mind that until we have the radio out of prototype and finalized for production, those operating ranges could change.

Topic: 220 Message: 293

There are a few different reasons a radio beeps when you first press the PPT. First is PTT-ID/ANI. This is a 5 tone or DTMF sequence sent everytime the PTT is pressed, it is decoded at the other end so they can see who is talking. A radio that is sending the ID will emit a beep while doing so. The other is a radio used on a trunked system. When you key your radio on a trunked system, the repeater will tell your radio what channel to use. It goes like this...
Key your radio
Radio transmits a "request" to the system
Radio listens for the response
Radio switches to that channel and that's when you get a 'beep' so you know you can start talking.

The AT-588UV has PTT-ID/ANI built in, so yes it would beep like you asked if it were programmed that way. It does not do trunking, so the other type of beep is a no.

I just bought an Alinco DX-SR8T HF transceiver. It has the hook type mic on it. I don't know if I really prefer one or the other but when the radio finally ships from China it should ship with the new speaker mic. But I would assume it will still have a hook instead of the older CB style mics that have a button post on the back.

I have to say that I absolutely HATE the hook type hangers. I like the button style as they actually hold the mic securely. I cant stand having the mic swinging around or moving. Hearing it rattle against something or seeing the cord jiggleing is very annoying to me, plus i just think that the hook style ones look awful and alot less professional. If the hook is attatched by a screw, then it would be easy enough to take it off and put a button in its place, which actually is a pretty good idea, that the manufacturers could start doing that, and including both styles in the box and let the user pick based off of preferance.

I suspect the hook allows for greater flexibility in hangers...IE, you can probably get some kind of hook hanger that clips or somehow interfaces with an air vent in the car...a button type hanger requires at least two screws to hold it in place, usually 3. A hook hanger only needs two, and doesn't require the stability that a button style hanger needs...button style hangers are usually tight and need to be well anchored...whereas a hook hanger really doesn't.
For durability, professionalism for some and other considerations, the button style hanger is more desirable, but the hook is actually far easier to take the mic off, and rehang it while driving than a button style.
Easy enough to buy the button post and mount it on the back of the mic if you really want. Also, with plastic button posts, they tend to wear and break off after a while, and a hook usually doesn't.

A person could make something that used an alligator clip wherever you wanted your microphone to reside when not in use. Be creative, it doesn't take a degree in engineering to come up with some kind of clamp mount. I've got some refrigerator magnet clamps that could be modified to where you could press the clamp open with your index finger while holding the microphone in the same hand The few I have are metal so I would punch the middle on both sides of the clamps slightly to give it an indent that would fit through the opening in the microphone hook making sure it wouldn't slide out.
Just one of several household items that could be used so the microphone wouldn't swing back and forth.

I've read the posts and actually this hook type hanger as opposed to the button on the back poses an interesting issue that could be a real nuisance.

With the radio going to be a Part 90 radio it could theoretically be used for commercial use. I plan to use it for both. All of the other manufacturers that build commercial radios use the button on the mic to encode the pl tones when it's on the hook either by grounding the button or there being something compressed when the mike is hung up. Unless you are an exclusive user on a frequency, opening the pl before transmitting is a necessity.

The hook creates a whole new set of problems for those of us that would use it for both services. I'm not interested in putting the radio into monitor before I pick up the mic.

Though I have been waiting patiently for this radio, this is a deal killer for me.

Even though this radio may be Part 90 certified, it will still be a ham radio.

300. Microphone

Yahoo group: Anytone_AT-588UV
Date: 2012-11-12 20:31:16 UTC
From: kingfish_stevens
Topic: 300 Message: 300

The microphone that will be supplied with the AT-588UV will NOT have the hanging ring on the back. It never did have one. What has been shown in pictures is not a photograph of the product, but a CAD drawing of the radio. As shown in the owner's manual, the mic will have the familiar hanging button we are all used to. The mic has been updated and will have a front-facing, built in speaker and a switch to deactivate all speaker buttons.

The radio is in the process of being FCC certified. Production will begin soon but I have not received a firm shipping date as of today. I hope to talk with Anytone tonight for an update.

Regards,
Ed Griffin

I guess not too many noticed the microphone in the owner's manual.
I like that style of microphone especially the large A/B button. My new
Alinco DX-SR8T HF all mode transceiver has a hook microphone but
I have no ambition to use it mobile except on 10 meters of which I have
an antenna for. So the hook isn't an issue otherwise. But that's me, I'm not
that particular. Especially when I see some over the road truck drivers
hang their CB microphones with rubber bands, bungie cords etc...Good to
know the mic will have a button mount as that may be a deciding factor in
purchasing the radio.

Subject: [Anytone_AT-588UV] Microphone

The microphone that will be supplied with the AT-588UV will NOT have the hanging ring on the back. It never did have one. What has been shown in pictures is not a photograph of the product, but a CAD drawing of the radio. As shown in the owner's manual, the mic will have the familiar hanging button we are all used to. The mic has been updated and will have a front-facing, built in speaker and a switch to deactivate all speaker buttons.

The radio is in the process of being FCC certified. Production will begin soon but I have not received a firm shipping date as of today. I hope to talk with Anytone tonight for an update.

Regards,
Ed Griffin

Since you can send a tone on TX when you push the ptt why would that not work out?

I use a local commercial repeater with this radio when I was testing it and it worked just fine.

Subject: [Anytone_AT-588UV] Re: Microphone Hanger

I've read the posts and actually this hook type hanger as opposed to the button on the back poses an interesting issue that could be a real nuisance.

With the radio going to be a Part 90 radio it could theoretically be used for commercial use. I plan to use it for both. All of the other manufacturers that build commercial radios use the button on the mic to encode the pl tones when it's on the hook either by grounding the button or there being something compressed when the mike is hung up. Unless you are an exclusive user on a frequency, opening the pl before transmitting is a necessity.

The hook creates a whole new set of problems for those of us that would use it for both services. I'm not interested in putting the radio into monitor before I pick up the mic.

Though I have been waiting patiently for this radio, this is a deal killer for me.

Even though this radio may be Part 90 certified, it will still be a ham radio.

The microphone will have a button mount on the back. The hook microphone pictured is from an older
CAD drawing and never existed except on paper.

Now that we've settled that I'm interested in your logic behind thinking that a hook mount is going to infringe on the operation of the microphone or the radio. I know the point is moot
but i don't understand your thinking.

I would hope to see memory groups but without the final
radio and owner's manual in my hands I can only say that
the radio should be technologically advanced enough
for a structured memory. The current owner's manual
say's nothing about memory channel grouping unless I
missed it and if I did, I'll joyously stand corrected.

Last heard, the radio is in the FCC certification stage. Mass production soon follows. Look for them early Dec if all goes well. I'm sure the manufacturer wants to avoid a 920R debacle by not rushing into production an inferior product that won't sell.

Ed of Import Communications had I think 10 of them, but they're all sold.
Meanwhile, the bugs have supposedly been worked out of the KG-UV920R and I see it is for sale by "no name" eBay vendors (the buggy units?), and by the more reputable 409Shop, RadioShop888, & perhaps others. About $90 over the AT-588UV. I'm tempted to give it another look, but still leery of getting a "first run" lemon.
At my "local" prices for Japanese equipment, the either one is still way more bang for the buck, if it performs. Time will tell, but like you I'm darned impatient!

According to Ed Griffin of importcommunications.com,

full production of the radio is scheduled for November 20.
Ed indicated he would receive some of the test run of 50 radios
the week of October 28. Don't know if that ever occurred
but those radios would have been pre-FCC certified and carry
no certification sticker. Ed expects to have product December first.
You can go to his site and request a notification by email when
the radios arrive.

It's my understanding that the AT588UV goes into production next Tuesday.
And they should be available in limited quantities from importcommunications.com
around December 1.

You can go to that site and follow the links to get an
email when the radios arrive around December 1. And maybe
even reserve one but I'm not sure about that. If the radio is
solid, hears and talks well they will be selling quick. I'm sure
out of the 326 members in this group that at least half will
buy one. That would be 163 radios. Some might buy two,
I think I've seen some membership request messages that
indicated that.

317. New Manual

Yahoo group: Anytone_AT-588UV
Date: 2012-11-15 20:00:55 UTC
From: Shane Black lord
Topic: 317 Message: 317

This is the manual for the new version of the AT-588UV. You will notice They have changed the name to AT-5888UV. Members have asked for pictures of the new microphone. It is on the front cover. It also explains programing. I got this directly from the Anytone Company. I have directly inquired if the problems noticed in the preproduction radios have been solved. I will let you know when I receive a reply.

Hello William

I am very sorry, I should have been clearer in my last letter. The Manual is in two parts and located in the file area, under AT 588 literature. You will need to download both parts to a folder on your
computer, and use 7zip to unzip the two part 7zip files back into the manual. I had to do this because Yahoo Groups (tm) will not allow files larger than 5120kb to be uploaded. You can Google 7zip, download and install it for free. Then double click on the Files Heading on the left side of your screen, and double click on the folder labeled AT-588UV Literature. Then right click on the files to download them one at a time, to a folder of your choice on your computer. Go to that folder, and use 7zip to extract the manual.

I hope that is clear enough, and not too confusing. Feel free to correct me if I am wrong. I Have had this manual for a few days but I have not had time to upload it until now. I hope the group finds it useful.

73 to all

Shane

PS I do not have a radio to test yet but I hope to have one by the end of Nov. or early Dec.

I want the link to this Anytone site. I see no AT-5888UV
at the manufacturer's site http://www.qxdz.cn/en/index.asp
Qixiang Electron Science.

Also the .001 .002 files are pretty useless to most.
.rar or .zip volumes are prefered.

So if you would Shane, please copy and past the URL where
you found the owner's manual.

Unfortunately Ed (or his source at Anytone) has a history of being a bit optimistic.

According to Ed's July email full production was to begin in early August. I seem to remember an October full production date as well.

Good question. I know the radio receives analog TV audio
but that's a thing of the past in this country. The jack by
description seems to output RF video but you know how
these Chinese - English translations can go. I guess I'll have to
wait until I get one to find out for sure exactly what kind of
information displays on a TV. It very well could be the display.

have you forgotten that there is stil analogue TV on VHF and UHF frequencies in most of the world?
This radio will be a receiver of those frequencies...so thus the TV-AV port.
I suspect there will be some kind of video encode/decode stuff in the radio so you can simply connect a monitor to the port to watch TV.
Might work pretty well for wireless security monitoring as well if the security system uses frequencies within the radios RX range to tx video.
Be nice if one could connect a camera to that port and transmit video as well.

I guess it's a wait and see game. There are other importers/dealers
that belong to this groups so I guess whoever gets the FCC approved
radio first will probably announce here or by email to customers who are
on a waiting or notification list or have prepaid. Personally I've got
things covered many times over so I'll wait. Those that can't will simply
find another radio.

Now there is an idea. Use the radio on one band
to watch the output of a surveillance multiplexer
on say channel 3 or 4 and then use the other side
of the radio to communicate with security guards and
such. That does make some sense.

True that. However I watch so little TV that it's of little importance to me at least. I've got a Nexus 7 android tablet I can wifi into my phone to use the 4G data and watch stuff without commercials on Netflix. But when I'm out of the house I hardly have the time for that except maybe tomorrow when I go for a regular doctor wellness visit.

They moved them around some to consolidate spectrum use,
but yes, essentially so.

The kids use a converter with a video projector - don't
watch much TV here either - generally crass & dumbed-down
content not worth the time.

I am curious about usage of the TV feature for ATV.

most of the ATV stuff is on 1.2ghz or higher, though I know of at least one ATV repeater that is on 439 here in alberta.
I don't see why it wouldn't work...just depends on the protocol of the signal...or what modes/codecs the built in circuitry can handle if that makes sence.

ATV may be either analog or digital, 420-432MHz & 438-442MHz,
910-916 & 922-928, & higher bands.

If permitted by local repeater rules ATV may pass through
them to improve distance.

ATV may be either analog or digital, 420-432MHz & 438-442MHz,
910-916 & 922-928, & higher bands.

If permitted by local repeater rules ATV may pass through
them to improve distance.

Yup, we used to fool around with a pair of Western Electric
1.6 ghz repeaters formerly used by Ma Bell to transmit phone
calls over terrain they couldn't wire. Well with the advent of
fiber, a ham invited myself and a couple others to tear out
what we wanted out of one repeater site that had been decommissioned.
We got two repeaters, boxes and crates of formerly unheard of Western
Electric tubes and vacuum relays. hundreds of feet of waveguide
and just about any electric goody you could think of in the era of
the 1970s. We were like kids in a candy shop. So a friend of mine
and myself built a couple small parabolics we hoped would somewhat
resonate at 1.6 ghz if resonate is what you want to call it clear up there.
and we sent back and forth come slow scan. Never did much and it
didn't take long to tire of it. But I still have a ton of copper in waveguide,
some Western Electric tubes the audiophiles love that sell for $50 bucks
each and many yards of coper braid, copper tape, microwave detector diodes
copper buss strips that weight 20 pounds each. I knew what to grab
while the other guys were in their with their mouths agape. I threw as
much copper into my pickup as would fit. I don't doubt there is a few
thousand or more bucks of it in my basement.

☐
most of the ATV stuff is on 1.2ghz or higher,
though I know of at least one ATV repeater that is on 439 here in
alberta.
I don't see why it wouldn't work...just depends on
the protocol of the signal...or what modes/codecs the built in circuitry can
handle if that makes sence.

From: kingfish_stevens
Topic: 339 Message: 339

Who knows why they do the things they do? To make a distinction between China mainland sales and Overseas sales, Anytone decided to change the model name to AT5888UV for the overseas market. I don't know why didn't they use this new number for the China market, especially since 888 has the meaning of good luck in China.

100 radios are being produced right now. I will get as many as 50 of these but all have been spoken for. Large production will begin Dec 1st and I'm waiting on a shipping date for December.

When I'm given a firm shipping date for December, I will email that information to everyone on my "notify" list and will begin accepting orders. To add your name to this list, look for "Request re-stock notice?" at the bottom of the web page

Hello Milton

Thank you for creating this group. Just to be clear, I did not download this manual from a public website, I was sent this manual by the staff at Anytone. I got the web address http://www.qxdz.cn from this web site and made numerous inquiries. If you would prefer to wait until it becomes publicly available I will remove it. Just let me know.

I was previously in contact with someone else, and after I asked about it on this website I contacted www.qxdz.cn directly and this as well as the software was sent to me.

Hello Milton

I looked at both Winrar and Winzip today, only to find out that both are trial versions with a limited time use before the trial expires, at which time you are expected to pay for the continued use. 7Zip, which is what I used is open source, free and readily available, which is why I used it.

Well we just got the lowdown on the name change for
radios that will be sold to the USA and to other countries.
Radios sold within mainland China will remain 888UV.
It doesn't make any sense but we will still support the radio
here. As far as the manual you uploaded to the group I just
had to know what you used to split the files. I use a MacBook
Pro and the RAR and ZIP programs didn't know what to do
with it. So I'll look for 7Zip for Mac but in the future I would
prefer a self extracting rar digest for files over the 5 meg limit.

347. New poll for Anytone_AT-588UV

Yahoo group: Anytone_AT-588UV
Date: 2012-11-16 13:34:15 UTC
From: Anytone_AT-588UV@yahoogroups.com
Topic: 248 Message: 347

Enter your vote today! A new poll has been created for the
Anytone_AT-588UV group:

OK I found out this morning that the radio's name has changed from AT-588UV
to AT-58888UV. But only those sold outside mainland China. Now there is always
the chance that someone might create a group named Anytone_AT-5888UV I
have no control over that but if you would, take a second and answer the poll
questions as follows:

o Should the Yahoo group name change to reflect the change in the radio's name
o Should the Yahoo group name remane the same
o Don't care either way

To vote, please visit the following web page:
http://groups.yahoo.com/group/Anytone_AT-588UV/surveys?id=2760978

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

348. Group name change

Yahoo group: Anytone_AT-588UV
Date: 2012-11-16 14:08:15 UTC
From: Milton Hywatt
Topic: 348 Message: 348

Ok I made a couple errors in the poll I created
but when you go to the poll they have been corrected.

I went ahead and created Anytone_AT5888UV in case
the poll favored changing the name of the group to reflect
the change in the radio name that will be sold outside of mainland
China. If enough favor a name change I will just delete the group
I created to hold the name then change the name of this group.
You also have the choice of just joining the new group named
Anytone_5888UV and everyone can do a mass exodus from here
to there, it makes no difference to me. Joining the new group
won't require approval I will shut that off once I get enough
input from the 325 members currently on this list.

Thanks for your patience and cooperation and let's hope
the Chinese don't pull any mor fast ones on us who have been
waiting months for a radio.

Hello

Why dont you just change the name to Anytone_588UV-5888UV@yahoogroups.com? That way when people with either one go looking they will find it.

Just a suggestion

Shane

350. Re: [Anytone_AT-588UV] Re: New poll for Anytone_AT-588UV

Yahoo group: Anytone_AT-588UV
Date: 2012-11-16 14:22:34 UTC
From: Milton Hywatt
Topic: 248 Message: 350

I've created AT_5888UV just in case people were in favor
of a name change. There aren't a lot of people with the
prototype version but I assume there are a few of them
lurking here in 588. The name change could also be
something like Anytone_588UV/5888UV. I do want more
feedback, hell the name might not even change and members
could jump groups or just stay here, it's too early in the game
I'll let the list members decide what they want to do after all
I created it for them. So please visit the poll and vote, the majority
will dictate what happens.

Subject: [Anytone_AT-588UV] Re: New poll for Anytone_AT-588UV

Hello

Why dont you just change the name to Anytone_588UV-5888UV@yahoogroups.com? That way when
people with either one go looking they will find it.

Just a suggestion

Shane

351. Anytone 5888UV manual in Winrar format now in the files area

Yahoo group: Anytone_AT-588UV
Date: 2012-11-16 23:02:09 UTC
From: Shane Black lord
Topic: 351 Message: 351

As requested By Milton Hiwatt, I have replaced the 7zip files containing the Anytone 5888UV Manual with files in Winrar format. I hope everyone finds them useful. Milton, could you please remove my previous messages concerning the 7zip files, to avoid confusion? Thanks and enjoy.
Shane

Topic: 351 Message: 352

Thank you so much Shane. I considered your input earlier
on a name change for the group but was unsure what your
response was and if it went beyond a name suggestion.
I want everyone to vote on the poll. That's the only way
I can get an accurate indication if the name even needs changed.
The only reason I'm offering to do this is for buyers of the
Anytone_AT-5888UV named radio searching Yahoo groups and coming
up with Anytone_AT-588UV then not knowing what to do. I guess by
creating Anytone_AT_5888UV today that might add to the confusion
but I had to own the name so someone else couldn't claim
ownership. So hey let's see if there is anyone that cares enough
to vote for a name change or not. I'll retain ownership of both
lists so that's not a problem, migrate over to 5888 if you wish.
I'll try to sync both groups if possible. I'm fairly new at this Yahoo
groups thingy but there may be a way to combine both groups.

Milt, AT-588UV, AT-5888UV list owner/moderator.

Hello Milt

I think that changing the name to AT-588UV/AT5888UV would be you best bet. Then you could retain ownership of both names and simply use them as pointers to the new combined group. That way you would only have to maintain one group, if you get what I am trying to so awkwardly explain....

I am happy you have started this group because I would not have time to run or moderate a yahoo group myself. I have run BBS groups in the past and they can be a pain, especially were keeping people on topic, and spam/virus's are concerned.

Also please don't let the "radio police" turn this board into a forum for them to show off their knowledge of the FCC Act. It has happened on other groups I belong to and the off topic crap tends to ruin the enjoyment of the group

Don't worry, so far you have done just fine, I've read every message on this group. I just wish I knew as much about radio as I do about computers. I would like to know for instance, how to use the TV out on this radio? does it just hook up to the composite input on a TV? and then hook up sound to the external speaker? or is it more complicated than that? I remember as a child before cable, the rabbit ears were hooked up with 300 ohm twin lead. Boy that makes me feel pretty old. LOL My son found a pair of rabbit ears and asked what in hell they were.

Just picture some ham goes and buys a brands new AT-5888UV and then goes on thweb looking for a group or info or such on the internet, I bet this radio is going to be very big! I all he finds is AT-588 he may be confused, this way you will have both parties covered. Other groups I belong to are multinational so this groups should be as well!

Thanks for your input. As far as the TV/AV output goes
what I've read from prototype owners is that it will output
a TV style modulated RF signal capable of being handled
by any TV that has a video A/V input. That won't do much
good in the USA where we've converted our broadcast to
digital bandwidth but it may be good for close circuit monitoring
in a situation where you communicate with security on the
UHF band and monitor video on VHF. That's only a good guess.
Other's say add a digital converter. Well that's ok as long as the radio
can tune the new digital frequencies.

My opinion is its just a name, and you're the owner. So just change it. The one that includes the new model name sounds logical to me. Otherwise there will end up being a split and a disconnect of information.

To: "Anytone_AT-588UV@yahoogroups.com" <Anytone_AT-588UV@yahoogroups.com>

I've created AT_5888UV just in case people were in favor
of a name change. There aren't a lot of people with the
prototype version but I assume there are a few of them
lurking here in 588. The name change could also be
something like Anytone_588UV/5888UV. I do want more
feedback, hell the name might not even change and members
could jump groups or just stay here, it's too early in the game
I'll let the list members decide what they want to do after all
I created it for them. So please visit the poll and vote, the majority
will dictate what happens.

357. How does the external speaker work

Yahoo group: Anytone_AT-588UV
Date: 2012-11-17 18:45:14 UTC
From: pyrolisys
Topic: 357 Message: 357

I have read the manual and I can't quite grasp how it works. The manual uses two track but how can it work on a mono plug. Will it only work for the main band? I am interested in remote mounting the head. I am replacing an older Kenwood dual band that is installed in my truck. It has two speakers that each cover one side of the radio.
Thanks
KE5MDM

The manual says to use a dual track speaker, it's an accessory they offer. How that works over a mono plug is anyone's guess. Maybe it is just poor translation from Chinese to English in the manual and the radio will output both the main and sub band audio out the speaker jack. Nothing else I can think of makes any sense besides that. If that is just an analog audio signal coming out the jack then it would have to contain both main and sub bands. Would be nice to have a schematic to verify that.

Topic: 357 Message: 361

There are 2 ways the external speaker port can work. It's operation is changed by MENU 52 "VSPCONT". When set to INT, a single external speaker will output both sides of the radio. When set to external, 2 speakers can be used, each outputing 1 side of the radio. Use a stereo plug, wire the shields together, 1 output goes to the left speaker, other goes to right. Left will output the left side, right outputs the right. Hope that answers your question.

We just recently got a few demos (2 weeks ago) and are putting these latest ones through their paces...so far seems most of the previous issues have been resolved. Still don't have a new mic (with speaker) or a mounting plate for the control head, but hoping these come along soon!

Yeah I figured the manual has lead some of us to believe the
speaker jack itself is mono. At least for me. So if you
get both sides on a mono plug, menu item 52 is set for INT.
As KD8BIW mentions in his post setting 52 to EXT
allows the use of a stereo plug to listen to each side of the
radio on a different speaker.

The demo AT588UV won't have a speaker mic. However
the finished model for sale outside of China is renamed
AT5888UV and ships with the speaker mic.

A stereo jack make sense, that was the last thing I was unclear on now I just have to wait for the production run. Maybe by Christmas, it will go on my list for sure.
Thanks for the insights.

and of course there is the whole thing about routing left or right audio to the internal speaker, speaker mic, and the external speaker and all the combinations that entails. Should be interesting.
I strongly suspect it'll be something like internal speaker and mic speaker combo, or external speaker left/right combined, or separate on a stereo plug...
The speaker in the mic will probably only be accessed in combination with the internal speaker but along with an external speaker.
Who knows how many options they will provide.

The demo AT588UV won't have a speaker mic. However
the finished model for sale outside of China is renamed
AT5888UV and ships with the speaker mic.

Subject: [Anytone_AT-588UV] Re: How does the external speaker work

There are 2 ways the external speaker port can work. It's operation is changed by MENU 52 "VSPCONT". When set to INT, a single external speaker will output both sides of the radio. When set to external, 2 speakers can be used, each outputing 1 side of the radio. Use a stereo plug, wire the shields together, 1 output goes to the left speaker, other goes to right. Left will output the left side, right outputs the right. Hope that answers your question.

We just recently got a few demos (2 weeks ago) and are putting these latest ones through their paces...so far seems most of the previous issues have been resolved. Still don't have a new mic (with speaker) or a mounting plate for the control head, but hoping these come along soon!

366. AT-5888UV Name Change Reason

Yahoo group: Anytone_AT-588UV
Date: 2012-11-18 13:42:40 UTC
From: Dale
Topic: 366 Message: 366

The reason for the name change is. Anytone has a radio in China that has the name AT-588, its a single band unit. There has been some confusion about the name being so close the single band unit so they changed the name of the Dual Band Mobile to AT-5888UV to avoid confusion in the future. In the past some buyers have ordered the AT-588UV from Chinese Wholesalers and ended up with the AT-588 Single Band Unit.

Yeah the external speaker has the option for a left
and right matching the sides of the radio or single.
The manual for the new radio is in the files section
of this news group under
Files > AT588UV Literature. It will explain the speaker mic options
if they aren't too badly translated from Chinese to English.

From: bphilippus
Topic: 368 Message: 368

Apparently at Kight Radio they have them for sale due to ship in a week.

http://www.kightradio.com/Anytone-AT-5888UV-Dual-Band-Mobile_p_18.html

Doesn't really indicate that it has the mic with the built in speaker.

It should be close to the over all dimensions of 5.47" x 1.57" however
the detachable control head is not square on the sides but I don't think
it's wider than 5.47" at any point on the sides.

I liken it to a Yaesu FT8800R. Don't know if anyone still sells
them new. I own an FT8900R which looks like the 8800R
but it's a quad band. And by the time you add tax you'll be
in the $500 range for the 8900.

Enter your vote today! A new poll has been created for the
Anytone_AT-588UV group:

Confucius Say: Importer, what sticker you want on radio. Either AT588UV or
AT5888UV. Question is how do I answer Confucius?

o Only sticker I want is the one that Says FCC Type Accepted
o I want the sticker to say AT588UV
o I want the sticker to say AT5888UV
o I don't give a rat's arse as long as it's FCC accepted
o I luv you long time

To vote, please visit the following web page:
http://groups.yahoo.com/group/Anytone_AT-588UV/surveys?id=2761400

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

Yeah Ed I realize that but Jeeze what's next, "we are changing
name to AT5088550UV? " Especially when you know both
588 and 5888 that have FCC certs are going to be identical.
Just trying to avoid confusion among importers who follow
this list. I guess the best way to illustrate that is if the radio
has FCC cert sticker it doesn't matter if it is badged 588UV or
5888UV. I'm also trying to be a bit proactive to avoid tech
support for both model numbers. And trying to keep the group
mindset as light hearted and entertaining as possible.

LOL funny! The radio should be shipping now from mainland China
to points around the world. There will be a little bit of favoritism among
importers as to who paid via out of stock order to who requested notification
and how many radios the importer gets first order. Man I used to deal with
this crap back in the CB radio days of yore. A new model comes out i contact
the supplier and try to order as many as I can for a list of 100 truck drivers
either waiting in line of who have pre-paid. I don't doubt the radio will be
available in less than 2 weeks. Now, what radio will you get? Order from the
wrong site and you may get a radio that isn't FCC type accepted. So it is better
if you don't rush into this. Keep abreast of the developments and go from there.

Probably a mute point. The factory has decided for the US market it will be AT-5888UV.
That's the model number used for the Part 90 certification.

Yeah Ed I realize that but Jeeze what's next, "we are changing
name to AT5088550UV? " Especially when you know both
588 and 5888 that have FCC certs are going to be identical.
Just trying to avoid confusion among importers who follow
this list. I guess the best way to illustrate that is if the radio
has FCC cert sticker it doesn't matter if it is badged 588UV or
5888UV. I'm also trying to be a bit proactive to avoid tech
support for both model numbers. And trying to keep the group
mindset as light hearted and entertaining as possible.

again, it sounds like a proto type model...he didn't state when he received that test radio, so anything he says about it is completely moot at this point until we can confirm or deny some of those statements with tests on the latest models.
Comparing apples to oranges here. Same basic design and functionality, but I'll bet most of the stuff he mentioned as flaws have been fixed with actual permanent builds of these radios.

I guess the point is that at least one importer was told
of a name change. And a group member gave the reason
for that so the 588UV wouldn't be mistaken for the AT-588
single band and importers wouldn't purchase the wrong radio.
But from what I've heard the radios are identical inside, one
will have AT-588UV sticker outside and AT-5888UV outside.
I though this was pretty ironic if the Anytone people changed the
export radio to AT5888UV to avoid confusion between the
existing AT588 mono band and the AT588UV dual. To me that
just adds to the confusion but regardless of 588/5888 just make
sure you are getting a radio with FCC certification sticker and
I can almost guarantee the radio is identical regardless of the model
name.

Yes the radio has hyper memory locations so that you can group different channels according to your preferences of what you can access at any given time. My Alinco DX-SR8T HF transceiver has these memories also. I can group channels by band so I don't have to scan or tune through different bands. So my memory banks are setup like 75 meters, 40 meters, 20 meters, 15 meters, 12 meters, 10 meters and so on. So if that's what you're looking for the 588/5888UV should do the job.

From: Milton Hywatt
Topic: 386 Message: 386

Have a great Thanksgiving (if you observe the holiday).
Our traditional meals is of course turkey. A 20 pound bird
in a deep fryer filled with peanut oil. I make stuffing baked
in the oven, Sautéed sausage seasoned with Sage. Diced
celery and sweet onion. Toasted bread, one loaf cubed.

Also on the menu, Acorn squash. Mashed
Idaho potatoes whipped. A roux gravy made from butter,
turkey stock and flour. And cranberry gel. That 's
it. Simple and you don't make yourself wish you never sat
down to the table. For you vegetarians, I suppose the squash
would be a good center. Both Acorn and Butternut. I like
them better than Yams or Sweet Potatoes because I grow
them myself from seeds that are at least a two decade product
of selecting the best of the crop.

After the dinner it's a glass of Macallan 18 single malt and retire
to the radio room. I do all the cooking but the cleanup is reserved
for family and friends. They don't mind in the least. NFL on the 55"
LG LED in the family room. I don't care for any of the teams on
this year. I think band conditions will be decent this Thanksgiving.
They are always good if you have the money to have an antenna
farm and an Alpha or Henry full legal limit amp. I do pretty good
on a vertical quad band. And soon a tri band end fed sloaper.

Well that's enough blabber from me. Thanks to all the the 348 members
of the group. Hopefully these radios will be here by the 1st of Dec.
I know some are here already, one new member states he has the
AT5888UV.

yes, happy turkey day to all of you south of the 49th parallel. In KL and KH as well.
We had our thanks giving last month up here in the frozen north.
Funny thing is that we hear more hyp about the American thanks giving holiday than the Canadian version. Mostly because any of the international chain stores figure that all their stores must have holiday friday sales...so we hear lots of commercials about huge sales etc.
Too bad they don't also mark their prices in US dollars as we'd save even more right now hi.

I'm still recovering from two thanks giving dinners :)

388. Data Port

Yahoo group: Anytone_AT-588UV
Date: 2012-11-23 00:53:00 UTC
From: Jason R
Topic: 388 Message: 388

I ordered my AT-5888 today, after receiving the pre-order invite from importcommunications.com. Looks like a great radio and I hope it works as well as those who have tested it say it does.

I will say this, I am dissappointed to find out the radio will NOT have a minidin data/packet jack on the back panel. I was really hoping for this feature since I am a big packet/APRS user. It seems that you always have to go for a dual-band to get this feature when it comes to Icom/Kenwood/Yaesu and the price is always in the $350-500 range. I was hoping that AnyTone would break this trend a bit and include it in model.

Here's to hoping for the future models...

Agree. For me the lack of a data port is pretty much a deal breaker. Seems like it would have taken so little to include the feature. Maybe down the road.

Not a deal breaker for me. I monitored the frequencies
that used to be active 1200 baud VHF packet
144.01, 03, 05, 07, 09 around here and it was dead.
I can remember back maybe 15 years ago nodes and
point to point chats were popular. I don't know what
happened to them all? On HF I've been listening
for some Baudot/RTTY and found some at 45 and 110
baud on 40 meters. Oddly though the mark and space
were reversed on a couple QSO's although there is nothing
against revrx operation. I imagine I'll need to do some data
mining to find out where the current digital stuff is happening
on HF. The commercial stuff I used to listen to is all encrypted
now so it's not decodable.

it would be a pretty simple job to build up an interface to the RJ45 mic jack for use with rx and tx packet.
You could even retain use of the regular microphone if you wanted.
Perhaps no separate dedicated jack, but certainly not impractical to make something up to use with what is there.
Don't forget, this radio is a chinese commercial radio first, and a ham radio second...they aren't going to build in specific amateur only features.

Unless they did something odd, such adapters are readily available.

I haven't kept up with the posts - is the mic jack wired the same
as a Kenwood - or some other common rig?

From: shansen@belljar.net
Topic: 388 Message: 395

We use Fldigi's VHF data modes (MT63-2000, multi-carrier PSKR) and EasyPal digital SSTV a lot for RACES work. We also use APRS for search and rescue. Not so much packet. We mix data and voice which requires a data port as opposed to using a mic and spkr cable adapter.

The mic jack is like a female ethernet connector.
But it has audio in and PTT. You could build a
conditioning speaker line with a 1:1 isolation
transformer and an impedance matching transformer
for the audio into the tnc easy enough. I've run digital
on many past radios that didn't have a data port. That's
just more of a convenience than anything else. One thing
I've noticed recently is that people aren't willing to build
things on their own. I don't know if it is because the FCC
dropped the code requirements or not.

Unless they did something odd, such adapters are readily available.

I haven't kept up with the posts - is the mic jack wired the same
as a Kenwood - or some other common rig?

> it would be a pretty simple job to build up an interface to the RJ45

From: Milton Hywatt
Topic: 388 Message: 397

My post only represents the good old TNC and
VHF packet on the specified frequencies that
we all used frequently before the internet to
send email across the country. I think my radios
do APRS but from what little I know about it,
it's not a way for hams to QSO, it's like ATIS
for aircraft flying in the vicinity of an airport.
So that really does me no good. Now, since the days I'd
been using and old DEC V-52 terminal with an AEA,
to later on using a PC with several different radios
a data port has never been any relevancy to me.
Any adaptor I needed to patch audio and PTT,
I made. There is no data port on my Alinco
DX-SR8T all mode HF rig and I do just fine.
So I guess it's more of a personal preference.
Don't get me wrong, I have a data port on my Yaesu
FT8900 and use it. I can't tell anyone for certain why
the AT5888UV is missing a data port other than
they may have needed to retool their CNC stuff
to add one adding cost to the radio when the idea
was to beat the competition in performance
durability, and price. But if you really need that
data port, I'm sure there is an Alinco out there
that has one.

Listen to 144.390. Your story will change. True, standard keyboard to keyboard packet is pretty much gone, however APRS is not. The data port is just as relevant today.

The EasyDigi interface is just that & is in kit form.

For $15.95 it saves the hassle of chasing down the parts
& creating a board (or point-to-point).

As the local AEC I'd like to learn more about your Emcomm apps.

Also, is the "data port" really much more than a post-emphasis
tap in the audio path?

Take for instance the

Yaesu FT8900. It has its own audio paths
out of the radio data/clone jack for 1200 and 9600 packet.
They both originate from the FM discriminator
output of the IF IC. 1200 goes through its own
HPF as does 9600. From there they are buffered
and sent out the data jack on separate pins. Incoming
packet data is taken in and split 1200/9600. 1200
is injected upstream from the preamp but before the amp.
9600 is injected after the mic amp. Both are buffered
along the way and 1200 passes through two LPF's before
it hits the mic amp.

So with 1200 or less, audio perfection is less of a concern.
But if you are going to use the radio higher than 1200
you probably want a radio that is built for speeds faster
than 1200 and unfortunately is not the AT-5888UV.
This just shows that the addition of the packet data buffering
circuitry could have caused a substantial increase in price
because to do it right you just don't tap the discriminator
and feed the packet data in after the mic preamp if you
want to do it correctly.

I'd like some input from anyone else who has used a
radio without a data port for 9600 baud packet.
And if you had any luck and if so how touchy it
is. If it wasn't so bad then 1200 < should be a breeze.

Is this radio going to ship locked to ham band only or will it ship wide open?
The reason I ask is I am wanting to use with Public safety (I am a member of a FD)in my other vehicle.
If anyone knows if this can be setup for that use without a lot of crap please let me know.
Thanks in advance.

The updated AT5888UV manual says
the export version will have expanded
coverage built in. So whatever they mean
by export gets TX 136 - 174 / 400 - 490.
Does Anytone mean export as in radios shipped
out of China to other countries? It's possible
but until I have a radio in my hands some time
next week I won't know for sure.

Code636 and I just got ours in today, after only one day of shipping from Hong Kong! Wow thats fast!

I just had a few concerns:

- This thing is a lot smaller than I thought it'd be, not that thats a problem.

- I was suprised by the design a little becuase I thought it was going to have AT5888UV on it...I hope it's not an old version....

- The microphone as a whole, as well as the volume dials are..eh...cheazy. They feel like I might rip them off if I turn or press them too fast....

- Included was a small box for the antenna cord. It is spooled up with one end as a regular end, the other...integrated into a megnetic base for the antenna. We plan on mounting ours externally on our cars, but this magnetic...base-station stand is useless. Hmm.

- Just for fun, in case I decide to remotely mount it (it's so small there isn't much of a point especially with the useless long-arse antenna cord), I checked the pinout of the CAT5 looking cord between the control head and radio. All but wire #6 and GND were good. I'll need to borrow code636's more accurate pinout tester-ma-bob to get useful results.

Does it have the FCC Type Approval sticker on it? The
AT5888UV should be 5.5" wide by 1.5 high by
4.7" wide and should have the speaker mike QHM-04.
The lettering on the buttons underneath the display should
be all white. If you didn't get this you might have got a
prototype because I think the final radio for mainland
China and their export will be what I described above
except the mainland version will say AT588UV while
the export will be AT5888UV.

Nope, no sticker at all. Its the AT-588UV, not 5888. Uses the old software, cant use newer. Says model not recognized. Pretty sure its the prototype. Can program in channels and still manually turn knob for 5khz increments. Does wide band and narrow. When you install the software, also have to install the usb driver that reads it. When you go to start program, theres a tab to install it. You may have to adjust your com port setting. Go to device driver tab in win xp. Double click the com lpt port icon, find the comport, double click it, go to resourses where it shows tha baud rate, click advanced tab on bottom, shows the 16550 uart, then change com port. took about an hour to figure it out so I could read the radio. Amazing enough, theres NO SERIAL NUMBER! Nada. Power cord has redundant glass fuses, AND the ground wire even has a fuse! Thats a new one on me. Uses pl259 ant connector. Its about 3/4 size of a mcs2000. When you remove head for remote, theres no mounting option for head. Nothing. No tabs. Going to have to figure this out. Will let you know more later.

It's likely a late prototype. And it make work fine and provide
you with years of service. But if you ordered an AT5888UV
that's what you should have got. The dimensions are similar to
my Yaesu FT8900. Except the length. The fan on the back of the
Yaseu does protrude maybe an inch and the heatsink is an inch longer.
Besides that the other two dimensions are nearly identical. And the
FT8900 has redundant fuses also. Most Yaesu mobiles had them.
The cable is supposed to come from the vehicle battery and any
wire pair installed on the battery coming inside the cabin should
be double fused. Good luck.

Its about 3/4 size of a mcs2000. When you remove head for remote,
theres no mounting option for head. Nothing. No tabs. Going to have to figure this out.
Will let you know more later.

As a matter of fact - code636 and I got non-FCC approved (prototype?) AT588UV's. There are no serials, no stickers, no limits ;)

- I also need to correct myself about the control head cord: it is in fact a standard CAT5 with standard A-type Ethernet pin out - my tester is Chinese so of course it broke from over-use. Excuse the irony.

- We can just get some regular mounting plugs/wire for the antennas.

- Used the QPS588UV_1.00 beta software provided on the yahoo files site, (no software included in package), powered her up, fiddled with COM ports (MAKE SURE TO INSTALL THE USB-COM DRIVER LOCATED WITH THE SHORTCUT IN THE PROGRAMS-GROUP LINK), and read just fine.

- It has trouble changing to mixed colors, still trying to get an orange to work.
- Enabled the damned squelch
- Tried 162.400 as the first channel, picked up NOAA just fine!
- Started programming known local channels as well as emergency channels (since we can program more the 700 why not?)

Only problems so far include the volume sensitivity. At zero, the small whine isn't a problem, but as soon as I move the crappy knob, NOAA started screaming in my damned ear. That's the very lowest stepping available on the knob! Hmmm.

Channels are fully programmable, not to mention I can listen on two VHF or two UHF channels at the same time! Programmed some GMRS channels on low power to test transmit, and boy did that work well! Very clear audio! Accidentally transmitted on NOAA for a bit without knowing, gotta make sure to disable TX in the channel options! xD

Remote mounting the head is gonna be a b**ch without any mounting screws on the HEAD ITSELF. Yarg. Center-console mounting will be difficult. Any ideas???

Hello

My name is Shane
I was told Menu 57? will allow you yo adjust the volume, Look in the manual it should be there, or download the manual from the files area.
I also have the software but I am not sure if it is any differat from the one you have.
Email me privately I have some questions for you.

Shane

My company was started by making TNC interface cables for any radio to any TNC. We still do this today and it's a large part of our business.

I don't need any help with building a cable with this common split mic jack/speaker jack setup. I brought up the question because just about all of the mid-range to high-end DUAL-BAND mobiles now have the standard 6 pin minidin data jack. This is not only a a nice feature, but is really a need when it comes to 9600 baud packet, since the pin is already there in the jack. Otherwise, there is some internal modifications that need to be done.

As for making a standard 1200 baud cable, there is nothing nicer than having this port to make the cable clean and easy to construct. We make the minidin cable all of the time (best seller) and it's not only easy for us to make, but very easy for the end user to plug in and get going without much headache at all.

My bottom line is, the data jack is a great feature that I would love to see in every mobile.

The AT588UV is IMO an economy brand so it is
no surprise the extra components to add a buffered
1200/9600 packet port to this radio were one thing
sacrificed in the name of cost. If you are looking
for that, the Yaesu FT8800 has one. But I think they
are around $100 more.

The nice thing is that the AnyTone is part 90 which (at least for us RACES types) is a real plus. As for 9600, very few radios are capable of that as the specs just won't hack 9600. 1200 is a different game.

Yeh 1200 is a no brainer. I never operated 9600.
If you look at the Yaesu FT8900 schematic there
is a lot of circuitry dedicated to buffering both
1200 and 9600 data to at least try to insure you've
got a chance on 9600. But I've never had problems
with 1200 right out the speaker jack and into the
mic input just as long as you don't run a voice
compander / compressor. And if you want to use
the AT5888UV for packet but want to buy the adaptor
there is at least one company I've seen who makes them.
Back before they started using modular mic jacks they
were easy to build. I've got a couple for a couple older
Kenwood HF rigs I own.

And the dust will settle. I can guarantee the 5888UV
will do 1200 packet. But at least around here that mode
has gone bye bye. After the great BBS and node wars.
I still work HF digital modes. But only when the bands
are up. Would be nice to have a 140 foot inverted V
but I have nowhere to put it.

418. Got it programmed...

Topic: 418 Message: 418

Ok, been working most of the day on it. got the cross band repeater going. tested it out on NOAA and GMRS, works great. Remember, when you set the Time out Timer, it does time out, and have to reset the option. Still working on that. Can set CTCSS encode & decode from unit itself or software. Working on Scrambler presets, can use a list or your own. Just have to learn the knob push sequence. After using it a bit, it starts coming to you. Biggest problem is the software. Its easy to use, its just assigning it a comport. It wants to assign its own, but will conflict with an already assigned comport. After adjusting it manually for computer & software to recognize each other, dont pull USB side out of your computer, if you do, and re insert it, it'll automatically want to reassign the comport again. Major PITA. Normally have to uninstall it under device manager com & lpt ports, and plug back in. Several times had to uninstall and reboot. Requires a lot of patience, but after you get it working, its very simple interface. Also, one of the mics chl buttons on side got stuck. couldnt access menu select unless I took mic out. finally figured it out. popped it back out, works fine again.

The USB interface cables for most radios don't like a lot of other USB devices connected where the actual program is concerned. The more devices connected, the higher the com port you can expect. If the com port id higher than the software allows then you have to visit Device manager and show Hidden devices. You might determine that some devices listed can be deleted because you haven't used them in years. Some of the old software I run in compatibility mode works fine but limits com port selection to 6 ports! So I've been a child of this USB to serial port game for years. And I understand what hoops a person might need to jump through to get a reliable connection to their serial device.

I'm very happy to see you got it / getting it worked out!

Milt, list owner/moderator.

Good to know we're not the only ones that can troubleshoot Windows device management! What code636 meant by the plastic button on the mic was that it gets stuck very easily because of the cheapo material. If you are unable to use the radio properly when the mic is in, it's because any one of the buttons are stuck! We just about called it quits when I noticed the stupid thing was stuck....whew!

That would be me. Some reason shows my old ID instead of current one. Getting things going now. Since we somehow got a magnetic base antennea with radios, have got a workaround for that. Already have MCS2000's in car with motorola antenneas, so swapping the antennea out for an NMO to SO239 adapter for the dual band antennea that came with unit, which has a SO239 type plug. Put that adapter onto the existing antennea mount and for $11, keep the AT-588 factory antennea. Than put a PL259 to Mini Uhf female adapter on radio for $5 to hook on to the pre-existing motorola antennea cable, since AT-588 has the PL259 antennea connector and its done. Beats spending $70 on a new antennea and mount. Reason why (1) Used to have a magnetic mount on CB, it absorbed moisture under mount and rusted trunk. Ick. (2) My sons Crown Vic has a factory aluminum trunk lid, so no way to put magnetic mount on trunk. Wish there was a way to remote mount the head, but theres no adapter for it. They had a good idea, they just fell short on it. Maybe take the allen screws off the main body head mount and find a way to put a backplate on it would work. Anyone have a good idea, please chime in. Why have a remote mount head that you cant mount? Head has the slide tabs on it, so cant just cut a hole in a blank panel and mount it. Company offering a spare head mount with a backplate to mount would be ideal. Thats it for tonight.

Any remote bracket would need to emulate the surface of the radio if there are no threaded posts on the backside of the control head. I forget which radio it was, maybe an older mono band Yaesu, that was configured like that. The others just snapped in the bracket like it did on the radio body. One I just took some double sided tape strips from 3M used by GM to hold some decorative stuff on their cars. Put them on the trim under the dash above the consol. It was made of a flat plastic not textured like common dashboard material. It didn't budge the 5 years I had the vehicle. If the radio is going to stay and you have the right surface you might consider the 3M tape.

As far as antennas go, I used an NMO mount on my 1990 Dodge Dakota sport 4x4. It had a roll bar with lights. I welded a piece of 1/4 steel plate in the middle and drilled
a hole for the mount. On top went a Diamond SG7500. Had trouble hitting limbs dangling over the roadways. Finally cracked the plastic that tapered down from the antenna to the center. I brushed on some epoxy and covered the thing all around that plastic, never had another problem.

I know what you're talking about when it comes to magnetic mounts. My old NMO mount was getting tattered on the bottom so I peeled off the foil covering the magnet and replaced it.
I bought new PL259 mount made by Comet. And a new dual band CSB 750A antenna. The PL239 mount is stronger than an NMO. And the base of the magnetic mount is covered by some teflon looking stuff so it's not likely to rust. That's what I use on my SUV. I like the hinged antenna the 750 A and 7500 employs. Pull up and lay the antenna horizontal to get into my garage.

426. Programming the AT-588UV aka AT-5888UV with software

Yahoo group: Anytone_AT-588UV
Date: 2012-11-30 18:29:12 UTC
From: kingfish_stevens
Topic: 426 Message: 426

The final version of the AT-5888UV software requires that the radio be attached to the computer before the software will open and allow you to play with the different settings and fields.

You can correct this problem by editing one of the .ini files located in the folder where the program was installed.

1- In the folder where the programming software is installed, open the folder "Language".
2- Right-click the file "mysetup.ini" and choose "open with Notepad".
3- In this document, change the value of "IsFirstRun=1" to read "IsFirstRun=0". (that's a zero in case you're a real novice)
Click "save file" and close.

The program should now start without having to first attach a radio to the computer.

I have included this information in a READMEFIRST file inside the software located for download at http://www.wouxun.us/Software/AnyTone-Software/QPS588UV_Setup_1.00.zip

Regards,
Ed Griffin

Hooray - Thanks, Ed!

Using this QPS5588UV Version 1.0.0 version, I started playing and find
that I get "Frequency Out of Range" error entering my friend's repeater
TX frequency on 449.675 MHz.

It looks as if any TX frequency beyond the non-EXP range gets the same
error, so it is enforcing those limits.
Is there a fix, or am I making a mistake?

Hey, I'm looking forward to this unit!

TX frequency on 449.675 MHz.

It looks as if any TX frequency beyond the non-EXP range gets the same
error, so it is enforcing those limits.
Is there a fix, or am I making a mistake?

Hey, I'm looking forward to this unit!

73, AC8FD

Subject: [Anytone_AT-588UV] Programming the AT-588UV aka AT-5888UV with software

The final version of the AT-5888UV software requires that the radio be attached to the computer before the software will open and allow you to play with the different settings and fields.

You can correct this problem by editing one of the .ini files located in the folder where the program was installed.

1- In the folder where the programming software is installed, open the folder "Language".
2- Right-click the file "mysetup.ini" and choose "open with Notepad".
3- In this document, change the value of "IsFirstRun=1" to read "IsFirstRun=0". (that's a zero in case you're a real novice)
Click "save file" and close.

The program should now start without having to first attach a radio to the computer.

I have included this information in a READMEFIRST file inside the software located for download at http://www.wouxun.us/Software/AnyTone-Software/QPS588UV_Setup_1.00.zip

Hello from a long time AT-588UV user!

The programming of the radio is a bit strange as it allows not just the frequencies to be programmed under the Normal Ch Edit. You have to program the limits under the Limit Ch Edit and as long as those limits are wide enough you should have no problem programming your 449 MHz frequency. I have set up L1 RX=108 MHz, U1RX= 180MHz, ... L3 RX and TX=350MHz and U3 RX and TX=490MHz. Read the Manual!

Best of Luck!
KD0PNQ - Trygve

TX is good up to 490MHz - how can 449.675 be a "Frequency Out of Range" error ?

From: William Hole AC8FD <ac8fd@wthole.com>
To: Anytone_AT-588UV@yahoogroups.com
Sent: Monday, December 3, 2012 9:44 AM
Subject: [Anytone_AT-588UV] Re: Programming the AT-588UV aka AT-5888UV with software

Hooray - Thanks, Ed!

Using this QPS5588UV Version 1.0.0 version, I started playing and find
that I get "Frequency Out of Range" error entering my friend's repeater
TX frequency on 449.675 MHz.

It looks as if any TX frequency beyond the non-EXP range gets the same
error, so it is enforcing those limits.
Is there a fix, or am I making a mistake?

Hey, I'm looking forward to this unit!

I believe the software is enforcing the limits for the NON-export version of the rig. Those limits are TX: 144~146 MHz and 430~440MHz and these are the limits I am seeing -- TX frequencies outside these limits gets the error.

The Export Spec is TX EXP(136~174MHz) and EXP(400~490MHz), so I expect we need programming software with the limits set for the Export model

Subject: [Anytone_AT-588UV] Programming the AT-588UV aka AT-5888UV with software

The final version of the AT-5888UV software requires that the radio be attached to the computer before the software will open and allow you to play with the different settings and fields. You can correct this problem by editing one of the .ini files located in the folder where the program was installed. 1- In the folder where the programming software is installed, open the folder "Language". 2- Right-click the file "mysetup.ini" and choose "open with Notepad". 3- In this document, change the value of "IsFirstRun=1" to read "IsFirstRun=0". (that's a zero in case you're a real novice) Click "save file" and close. The program should now start without having to first attach a radio to the computer. I have included this information in a READMEFIRST file inside the software located for download at http://www.wouxun.us/Software/AnyTone-Software/QPS588UV_Setup_1.00.zip Regards, Ed Griffin http://www.importcommunications.com/

I own a Yaesu FT8900. Very solid radio. Physical dimensions
are practically identical to the 5888UV. One bad thing about the
FT8900 you lay it down on your bench to use it for a base it
becomes very hot to the touch. This was on UHF and I have
a standing wave of 1.1:1 I did have a piece of that matter shelf
covering that is rubberized, you would use it in your pantry
or your cupboard in the kitchen. But it is thin and no way impedes
airflow, the heat sink running on the bottom. However the 5888UV
heatsink is on the top so once I get mine I'll test them side by side.

I'm sure Ed will rectify the order and refund the extra charge.
When I first ordered a Wouxun radio from him I ended up with
two extra batteries instead of one in my cart and didn't realize
it until it was too late. Since the radio and extras were to ship the
next day I wanted him to change the order to one battery. So he
fixed the order. I know we are talking a big difference in price
but I feel that there are other reasons involved in his business
that have priority since the radios aren't shipping for another 10 days
or so, plenty of time to rectify the order and refund the price of
the 2nd radio.

5888 has a great heatsink and also a fan so I'm sure it will stay pretty cool.
I had 3 8900 but I didn't use 6 nor 10 meters so I sold them.
I'm looking at the 8800 right now - they're having a great sale.

You can correct this problem by editing one of the .ini files located in the folder where the program was installed. 1- In the folder where the programming software is installed, open the folder "Language". 2- Right-click the file "mysetup.ini" and choose

"open with Notepad". 3- In this document, change the value of "IsFirstRun=1" to read "IsFirstRun=0". (that's a zero in case you're a real novice) Click "save file" and close. The program should now start without having to first attach a radio to the computer. I have included this information in a READMEFIRST file inside the software located for download at http://www.wouxun.us/Software/AnyTone-Software/QPS588UV_Setup_1.00.zip Regards, Ed Griffin http://www.importcommunications.com/

447. Re: [Anytone_AT-588UV] Programming the AT-588UV aka AT-5888UV with software

Yahoo group: Anytone_AT-588UV
Date: 2012-12-04 19:38:57 UTC
From: Milton Hywatt
Topic: 426 Message: 447

I use my FT8900 in house because I have a AR 6 Ringo
6 meter vertical and 5BTV vertical that covers 10/15/20/40/80 meters
But I also own an Alinco DX-SR8T all mode 10 - 160 HF 100 watt
HF rig. So I have the 8900 hooked into a AR-270B and AR-6.
I used to own a Icom 706 MKII G but it was serviced for the same
problem 3 times before they got it right then I sold it. Nice radio
for 160 - .70. So now it takes 2 radios. I'm buying the 5888UV to
permanently mount in my SUV so I can have more than a 5 watt
Wouxun KG-UV6D HT in the mobile. I'll get some automotive double
sided tape and tape the control head to the dash and throw the radio
under the seat. I did that with another Yaesu dual bander I think it wat
an FT7900 in my Nissan Pathfinder. Worked great.

I'm sure Ed will rectify the order and refund the extra charge.
When I first ordered a Wouxun radio from him I ended up with
two extra batteries instead of one in my cart and didn't realize
it until it was too late. Since the radio and extras were to ship the
next day I wanted him to change the order to one battery. So he
fixed the order. I know we are talking a big difference in price
but I feel that there are other reasons involved in his business
that have priority since the radios aren't shipping for another 10 days
or so, plenty of time to rectify the order and refund the price of
the 2nd radio.

Supposedly there were 50 radios headed to the US from
a practice run. These are full fledged 5888UV's And a
few who pre-paid will receive one along with some other
dealers and myself. The next 100 should be delivered to the
USA by the 15th. Pre-order and first come first served will
get those. I'm guessing they will be ordered by the hundred
again if sales go well. After that I won't even guess how they
are ordered to be kept in stock. I'm sure there are some financial
considerations that will affect things.

I own a Yaesu FT8900. Very solid radio. Physical dimensions
are practically identical to the 5888UV. One bad thing about the
FT8900 you lay it down on your bench to use it for a base it
becomes very hot to the touch. This was on UHF and I have
a standing wave of 1.1:1 I did have a piece of that matter shelf
covering that is rubberized, you would use it in your pantry
or your cupboard in the kitchen. But it is thin and no way impedes
airflow, the heat sink running on the bottom. However the 5888UV
heatsink is on the top so once I get mine I'll test them side by side.

The final version of the AT-5888UV software requires that the radio be attached to the computer before the software will open and allow you to play with the different settings and fields. You can correct this problem by editing one of the .ini files located in the folder where the program was installed. 1- In the folder where the programming software is installed, open the folder "Language". 2- Right-click the file "mysetup.ini" and choose "open with Notepad". 3- In this document, change the value of "IsFirstRun=1" to read "IsFirstRun=0". (that's a zero in case you're a real novice) Click "save file" and close. The program should now start without having to first attach a radio to the computer. I have included this information in a READMEFIRST file inside the software located for download at http://www.wouxun.us/Software/AnyTone-Software/QPS588UV_Setup_1.00.zip Regards, Ed Griffin http://www.importcommunications.com/

I use my FT8900 in house because I have a AR 6 Ringo
6 meter vertical and 5BTV vertical that covers 10/15/20/40/80 meters
But I also own an Alinco DX-SR8T all mode 10 - 160 HF 100 watt
HF rig. So I have the 8900 hooked into a AR-270B and AR-6.
I used to own a Icom 706 MKII G but it was serviced for the same
problem 3 times before they got it right then I sold it. Nice radio
for 160 - .70. So now it takes 2 radios. I'm buying the 5888UV to
permanently mount in my SUV so I can have more than a 5 watt
Wouxun KG-UV6D HT in the mobile. I'll get some automotive double
sided tape and tape the control head to the dash and throw the radio
under the seat. I did that with another Yaesu dual bander I think it wat

an FT7900 in my Nissan Pathfinder. Worked great.

454. AT-588UV or AT-5888UV?

Yahoo group: Anytone_AT-588UV
Date: 2012-12-09 09:27:56 UTC
From: ddlevine1
Topic: 454 Message: 454

I just received my radio from Kight Radio. I ordered an AT-5888UV , the unit I received was labeled AT-588UV. There are no other labels or serial numbers anywhere on the unit except on the top of the control head which is labeled AT-588UV. Shouldn't this unit have a serial number and model number on the main unit? And if this is FCC certified have a label stating so? Has anyone else seen their units labeled like this after ordering a AT-5888UV?

I know of another who got their radio maybe a week ago and it
was labeled AT588UV. His was not an AT5888UV with the
AT588UV label on it. It would not work with the newer software
for the AT5888UV. Had no FCC sticker or serial number. I'd have
to assume it was a late prototype but couldn't be sure. On a production
model radio I would expect to see a serial number.

I just received my radio from Kight Radio. I ordered an AT-5888UV , the unit I received was labeled AT-588UV. There are no other labels or serial numbers anywhere on the unit except on the top of the control head which is labeled AT-588UV. Shouldn't this unit have a serial number and model number on the main unit? And if this is FCC certified have a label stating so? Has anyone else seen their units labeled like this after ordering a AT-5888UV?

Please do post your follow ups, it's about all we have to
go on for now. I should be receiving my 5888UV tomorrow
or Tuesday from importcommunications.com. I know for
certain that the radios purchased from Ed will be production
units that are FCC part 90 certified. They will have the new
speaker-mic, and will work with the latest programming software.
Ed has included a free program cable with the first 100 radios
shipped. So I'll let everyone know what to expect from Ed
if they have or are planning to purchase from http://importcommunications.com.

Looks like ED updated the info to this:

"Full factory production began December 1st with estimated delivery dates of December 12th and 17th. Our shipping will begin as soon as radios are delivered."

Take in consideration that right now customs is very busy, there could be delays. Consider your self lucky if you get it before Christmas.

Ah ok. So if it has the new speaker mic you probably
have one of the final prototypes. That would have
been a sample while the FCC was certifying them.
This is only a guess. I know that Anytone offered
at least one dealer I know the option of shipping
the radios with either the AT588UV or AT5888UV
badge. Myself I don't care as long as I'm getting what
would eventually or is currently FCC part 90 certified.
Keep us informed and hopefully I'll receive my radio
tomorrow or Tuesday. Supposedly it was sent out no
later than Friday and I'm only 3 days UPS standard shipping
away from the dealer. I'm sure we can put some of the
confusion away for good once I have a production unit
in my hands.

Also take into consideration that Ed is no doubt
very busy with his business and personal life during
the holidays.
But if he says your unit will be shipped on a certain
date I would count on that because it's not good
business strategy to do otherwise and keep a competitive
edge over your competition.

From: Anytone_AT-588UV@yahoogroups.com
> Myself I don't care as long as I'm getting what
> would eventually or is currently FCC part 90 certified.

But if the radio is labeled AT-588UV instead of AT-5888UV then it is NOT the model covered by the FCC equipment authorization number (even if the only difference is the label!)

If you need a Part 90 certified radio, you need to be sure the dealer understands that you will refuse any radio that does not have the required FCC ID label _and_ that matches the model information on file with the FCC for that ID number.

I was going to attach a PDF of the FCC ID label taken directly from AnyTone's information on the FCC website, but Yahoo (in its infinite wisdom) doesn't allow reply emails from people using the digest subscriptions any more. So instead I have uploaded that PDF to the files area for the group.

What you don't know is my importer was offered which badge
he wanted, either AT-558UV or AT-5888UV on the finished product.
He's emailed me today, evidently lost my mail address from my last purchase
so I would expect to have the finished product in my hands this week.
That way I'll be able to see exactly what gives with a radio I know for
certain not to be a prototype and that will be FCC tagged.

Subject: [Anytone_AT-588UV] Part 90 Certification

From: Anytone_AT-588UV@yahoogroups.com
> Myself I don't care as long as I'm getting what
> would eventually or is currently FCC part 90 certified.

But if the radio is labeled AT-588UV instead of AT-5888UV then it is NOT the model covered
by the FCC equipment authorization number (even if the only difference is the label!)

If you need a Part 90 certified radio, you need to be sure the dealer
understands that you will refuse any radio that does not have the required FCC ID label
and that matches the model information on file with the FCC for that ID number.

I was going to attach a PDF of the FCC ID label taken directly from AnyTone's information
on the FCC website, but Yahoo (in its infinite wisdom) doesn't allow reply emails from
people using the digest subscriptions any more. So instead I have uploaded that PDF to the
files area for the group.

468. AT-588UV/5888UV first impressions

This is just my basic first impression of the radio
by appearance only. I haven't even powered it up
yet.

First thing I noticed was the overall length including
the heat sink extension in the rear is longer than the
specs in the manual. The radio is actually longer by
half an inch or so than my Yaesu FT8900. The entire top
of the radio is die cast heat sink so there should be no
problems with overheating. It kind of reminds me of the
75 watt mono band Yaseu's heat sink. Other than that it
it identical in size and weight to the FT8900. It even uses
the same power cord disconnect the FT8900 does so I won't
need to rewire my SUV. My AT588UV comes with serial
number and FCC sticker. Yes I typed that right 588UV not
5888UV. The box says AT5888UV but 588 is silk screened
on the plastic bezel. Guess they haven't figured just what
to call them yet LOL. Anyway this was one of the first batch
of a 100 final production units to arrive at importcommunications.com
and I did expect it to be badged 588 but it does have a serial
number, FCC sticker and the new button mount speaker mic.
My first impression of the control head is that it seems well built.
rotating controls, buttons all have a good solid feel. One thing I did
notice is the control head fits into the radio body a little more loose
than I like but a small block of foam rubber placed inside would
cure that. So at least from a physical standpoint the radio seems
plenty robust. Oh and one oddity, on the left side of the control
head where the latch is, there is a USB-A port. I'm guessing this
is for dealer firmware upgrades since the programming cable
goes in the mic jack. My radio did not come with a control head
remote bracket or owner's manual. The dealer agreed to have those
shipped later if Qixiang would just ship the radios so he could get
them sent out. The dealer will ship those out to whoever purchased
from importcommunication.com as soon as he gets them in.

I will be back soon with my impressions on the radio's performance
and the software's ease of use and how the two interact as soon as
I take care of my online businesses.

Sounds like someone is a happy camper right now. Can't wait for more details.

Strange about the 588 vs 5888 tho - Wonder if they're shipping the old batch 588 first and just stick the FCC label on it.

Ed must be pretty busy right now with all the shipping. NR7J

I remember seeing a reference to that on an earlier thread that said it's a
convenience port for 5V charging of cell phones, etc. Don't have a link
offhand though.

If you recall, the radios that were to be sold in mainland
China were to be designated AT588UV. Only the exports
were to be AT5888UV. Maybe they changed their mind?
Anyway I'll be hooking it up as soon as I can get off the
computer, it's nice that I can use the Yaesu FT8900 power
cord in my 40 amp Diamond DC supply and the cord in my
SUV, both will work with the AT5888888888UV :-)

This is just my basic first impression of the radio
by appearance only. I haven't even powered it up
yet.

First thing I noticed was the overall length including
the heat sink extension in the rear is longer than the
specs in the manual. The radio is actually longer by
half an inch or so than my Yaesu FT8900. The entire top
of the radio is die cast heat sink so there should be no
problems with overheating. It kind of reminds me of the

75 watt mono band Yaseu's heat sink. Other than that it
it identical in size and weight to the FT8900. It even uses
the same power cord disconnect the FT8900 does so I won't
need to rewire my SUV. My AT588UV comes with serial
number and FCC sticker. Yes I typed that right 588UV not
5888UV. The box says AT5888UV but 588 is silk screened
on the plastic bezel. Guess they haven't figured just what
to call them yet LOL. Anyway this was one of the first batch
of a 100 final production units to arrive at importcommunications.com
and I did expect it to be badged 588 but it does have a serial
number, FCC sticker and the new button mount speaker mic.
My first impression of the control head is that it seems well built.
rotating controls, buttons all have a good solid feel. One thing I did
notice is the control head fits into the radio body a little more loose
than I like but a small block of foam rubber placed inside would
cure that. So at least from a physical standpoint the radio seems
plenty robust. Oh and one oddity, on the left side of the control
head where the latch is, there is a USB-A port. I'm guessing this
is for dealer firmware upgrades since the programming cable
goes in the mic jack. My radio did not come with a control head
remote bracket or owner's manual. The dealer agreed to have those
shipped later if Qixiang would just ship the radios so he could get
them sent out. The dealer will ship those out to whoever purchased
from importcommunication.com as soon as he gets them in.

I will be back soon with my impressions on the radio's performance
and the software's ease of use and how the two interact as soon as
I take care of my online businesses.

I remember seeing a reference to that on an earlier thread that said it's a convenience port for 5V charging of cell phones, etc. Don't have a link offhand though.

Sounds like someone is a happy camper right now. Can't wait for more details.

Strange about the 588 vs 5888 tho - Wonder if they're shipping the old batch 588 first and just stick the FCC label on it.

Ed must be pretty busy right now with all the shipping. NR7J

This is just my basic first impression of the radio
by appearance only. I haven't even powered it up
yet.

First thing I noticed was the overall length including
the heat sink extension in the rear is longer than the
specs in the manual. The radio is actually longer by
half an inch or so than my Yaesu FT8900. The entire top
of the radio is die cast heat sink so there should be no
problems with overheating. It kind of reminds me of the
75 watt mono band Yaseu's heat sink. Other than that it
it identical in size and weight to the FT8900. It even uses
the same power cord disconnect the FT8900 does so I won't
need to rewire my SUV. My AT588UV comes with serial
number and FCC sticker. Yes I typed that right 588UV not
5888UV. The box says AT5888UV but 588 is silk screened
on the plastic bezel. Guess they haven't figured just what
to call them yet LOL. Anyway this was one of the first batch

of a 100 final production units to arrive at importcommunications.com and I did expect it to be badged 588 but it does have a serial number, FCC sticker and the new button mount speaker mic.
My first impression of the control head is that it seems well built. rotating controls, buttons all have a good solid feel. One thing I did notice is the control head fits into the radio body a little more loose than I like but a small block of foam rubber placed inside would cure that. 479. OK My initial report on the AT-588UV

Yahoo group: Anytone_AT-588UV
Date: 2012-12-13 02:34:16 UTC
From: Milton Hywatt
Topic: 479 Message: 479

First of all I'd like to say that the radio firmware reports the model being QX588UV. QX being the manufacturer Qixiang Electron Corp. Production date as reported by the radio is 11-28-2012.

I measured power output using a 50 watt dummy load and a meter designed for 144/440. Tests was conducted on a 40 watt continuous duty Diamond GZV4000 @ 13.8 VDC. Current draw at full power on 2 meters was 10 amps.
On 440 power output was 30 watts. On 144 power was 61 watts. The power didn't deviate in the commercial / public bandspace.

I couldn't get ahold who has a Marconi Aeroflex test set to really dive into the receiver sensitivity
but I did work a repeater about 50 miles away on 2 meters and received it full quieting with a 20 over 9
signal. A .70 cm repeater about 20 miles away gave me a 10 over 9 with just an alligator test lead stuck
in the S0239 on the back of the radio so the radio has excellent ears. Audio quality is above average
but there are some barely noticeable artifacts in the audio when both sides of the radio are receiving a
signal. And it's only noticeable at very quiet volume levels. And these artifacts only appear on a certain
combination of frequencies most notably uhf on one side and vhf on the other. I do like the speaker mic.
It's almost as lit up as my Christmas tree but you can dim it and the pushbuttons around the display using
a function setting. The LCD display has three colors and 32 levels of intensity to choose from in many possible
combinations. Blue at the max setting of 32 and green at 32 and red at 28 gave me the brightest shade of blue.
So there is really no way to have the pictured amber display.

The microphone indicates which side of the radio is active for making changes and transmitting. Under the keypad
the A B indicators illuminate as to the active band. Above the keypad the A B indicators illuminate green for rx and
red for tx so the only thing the mic is missing is a frequency display LOL! I have not tried the speaker in the mic yet.

I asked a friend to come over and talk to me on the AT588UV while I went mobile with the Yaesu FT8900. I thought
the AT588UV sounded great even without the compandor enabled. And I did some heat tests also. I talked simplex
for some time to a friend about 25 miles away. I noticed the heat sink was warm to the touch but the fan hadn't turned
on. So I went back on dummy load and held the key down for 60 seconds. By that time my 50

watt dummy load was getting
almost too hot to touch (this was on 2 meters) but the dummy load has fins on it so I wasn't worried about it too much.
The heatsink on the radio was still warm to the touch but no fan. So I transmitted another 60 seconds at 61 watts and finally
got some fan action. But to tell the truth the heatsink was luke warm although it did start to warm up a little right away at the beginning
of my test. That tells me there is good thermal transfer between the output mosfet and the heatsink.

Ok now for the not so good things :-(

Squelch. There is some odd interaction between sides of the radio and specific frequencies that cause the squelch
to open or the signal meter to deflect fully on a non CTCSS decode channel. This seems to be more prominent when
you are monitoring ham and public service bands. I upped the squelch levels on each side using the software and that
seems to eliminate 99% of this oddity. Squelch is factor set for 4 on both sides.
Software. QPS588UV version 1.0. What a joke. I was lucky to upload a few repeaters and some police departments
into the radio and save that template so I could have something to fall back on. But it seems as if when I read data
from the radio then try to change function settings and write them to the radio I get an error 9 string something or other. When
you close that out and exit the write, the program crashes and disappears. Also the Prolific 2032 chipped cable likes to grab
the first driver it sees. As an avid user of USB to serial devices I had no less than 4 drivers for Prolific on my system. None
of them mentioned for the 2032 device so I chose the latest date driver and it worked. The driver software is part of the
programming software and you install it separately. And if you have other versions of Prolific drivers and the USB cable
grabs one of those first and it doesn't work, hopefully you'll have the savvy to correct the driver version issue. You should
install the software first, then go to the software folder and run the UsBtoComPort.exe file, that installs the driver. Then
you can plug your USB cable in and hopefully it will install the right driver.

So other than the squelch/signal meter oddity, and the fact that the display seems to be lit by
only one led on the right side I'll have to still give it an 8 out of 10.

Xmit audio on .70 was good. I think Qixiang rated it at 40 watts? My Yaesu is dead on 35 on .70 as rated so I know the meter is ok. The only real stinker is the software. I'm using Windows 7 in the XP compatibility mode. But the software crashes on just about everything you try to write. Even if you download from the radio and try to write it back to the radio. Luckily the instruction manual is well enough translated to let you do your SET functions manually. And that's what I did. When I tried to write the radio back to the PC with the SET functions I hand programmed the software crashed. Very disappointing. And stupid :-)

you close that out and exit the write, the program crashes and disappears. Also the Prolific 2032 chipped cable likes to grab

the first driver it sees. As an avid user of USB to serial devices I had no less than 4 drivers for Prolific on my system. None
of them mentioned for the 2032 device so I chose the latest date driver and it worked. The driver software is part of the
programming software and you install it separately. And if you have other versions of Prolific drivers and the USB cable
grabs one of those first and it doesn't work, hopefully you'll have the savvy to correct the driver version issue. You should
install the software first, then go to the software folder and run the UsBtoComPort.exe file, that installs the driver. Then
you can plug your USB cable in and hopefully it will install the right driver.

So other than the squelch/signal meter oddity, and the fact that the display seems to be lit by
only one led on the right side I'll have to still give it an 8 out of 10.

"The LCD display has three colors and 32 levels of intensity to choose from in many possiblecombinations. Blue at the max setting of 32 and green at 32 and red at 28 gave me the brightest shade of blue. So there is really no way to have the pictured amber display."
Red, blue, and green with various intensities should, in theory, make any color you desire. (Think RGB monitor.) Yellow is red plus green. Try knocking down the unwanted blue, and play with around with red and green to get the shade you want.

First of all I'd like to say that the radio firmware reports the model being QX588UV.QX being the manufacturer Qixiang Electron Corp. Production date as reportedby the radio is 11-28-2012.
I measured power output using a 50 watt dummy load and a meter designed for 144/440.Tests was conducted on a 40 watt continuous duty Diamond GZV4000 @ 13.8 VDC. Currentdraw at full power on 2 meters was 10 amps.On 440 power output was 30 watts. On 144 power was 61 watts. The power didn't deviatein the commercial / public bandspace.
I couldn't get ahold who has a Marconi Aeroflex test set to really dive into the receiver sensitivitybut I did work a repeater about 50
miles away on 2 meters and received it full quieting with a 20 over 9signal. A .70 cm repeater about 20 miles away gave me a 10 over 9 with just an alligator test lead stuckin the S0239 on the back of the radio so the radio has excellent ears. Audio quality is above averagebut there are some barely noticeable artifacts in the audio when both sides of the radio are receiving asignal. And it's only noticeable at very quiet volume levels. And these artifacts only appear on a certain combination of frequencies most notably uhf on one side and vhf on the other. I do like the speaker mic.It's almost as lit up as my Christmas tree but you can dim it and the pushbuttons around the display usinga function setting. The LCD display has three colors and 32 levels of intensity to choose from in many possiblecombinations. Blue at the max setting of 32 and green at 32 and red at 28 gave me the brightest shade of blue. So there is really no way to have the pictured amber display. The microphone indicates which side of the radio is active for making changes and transmitting. Under the keypadthe A B indicators illuminate as to the active band. Above the keypad the A B indicators illuminate green for rx andred for tx so the only thing the mic is missing is a frequency display LOL! I have not tried the speaker in the mic yet.
I asked a friend to come over and talk to me on the AT588UV while I went mobile with the Yaesu FT8900. I thought the AT588UV sounded great even without the compandor enabled. And I did some heat tests also. I talked simplexfor some time to a friend
about 25 miles away. I noticed the heat sink was warm to the touch but the fan hadn't turnedon. So I went back on dummy load and held the key down for 60 seconds. By that time my 50 watt dummy load was gettingalmost too hot to touch (this was on 2 meters) but the dummy load has fins on it so I wasn't worried about it too much. The heatsink on the

radio was still warm to the touch but no fan. So I transmitted another 60 seconds at 61 watts and finallygot some fan action. But to tell the truth the heatsink was luke warm although it did start to warm up a little right away at the beginningof my test. That tells me there is good thermal transfer between the output mosfet and the heatsink.
Ok now for the not so good things :-(
Squelch. There is some odd interaction between sides of the radio and specific frequencies that cause the squelchto open or the signal meter to deflect fully on a non CTCSS decode channel. This seems to be more prominent whenyou are monitoring ham and public service bands. I upped the squelch levels on each side using the software and thatseems to eliminate 99% of this oddity. Squelch is factor set for 4 on both sides.Software. QPS588UV version 1.0. What a joke. I was lucky to upload a few repeaters and some police departmentsinto the radio and save that template so I could have something to fall back on. But it seems as if when I read datafrom the radio then try to change function settings and write them to the radio I get an error 9 string something or other. When you close that out and exit the write, the program crashes and disappears. Also the Prolific 2032 chipped cable likes to grabthe first driver it sees. As an avid user of USB to serial devices I had no less than 4 drivers for Prolific on my system. Noneof them mentioned for the 2032 device so I chose the latest date driver and it worked. Already tried it, if you get close to an amber-ish color it's too dark. Remember these are LED lights and don't follow the rules of RGB color mixing because the red is more of a purple. Besides I don't like amber anyway.

From: George Dunagin
Topic: 479 Message: 486

Unit is as Milt stated in all respects. I won't repeat it all here. The receiver is very sensitive, I tried the NWS freqs just as a lark and could copy Gainsville, GA and Gwood, SC FB. I can hit the Gwood repeater with 10 watts and was told my audio was awesome. That repeater is over 80 air miles away. (I live in Henderson Co. NC abt 15 air miles south of Asheville) I have not set the compander as I have no background noise. After a 20 minute QSO on 2 meters the heatsink was barely warm and no fan. Audio report was well the ham said "You are where, running how many watts!?" And the audio is STRONG!
I have only been in it (the radio/program) for abt 45 mins so I will dig deeper and update. The hookup was easy (I have a dedicated XP machine) and I just plugged the adapter in, selected the comm port and read and wrote to the radio. I run my HF on this computer too with HRD and my scanner and my HT.

I am looking forward to all the updates and input as we learn about this new radio. I'd like to thank Ed for his determination and fine work. I know he jumped through many hoops and probably pulled a few hairs out in this. It's great Ed! And hats off to you and yours, ya did good! I have had many radios in 32 years and cannot see anything to complain about here. Thanks to all in the group and on the air too. Having beena net control and net manager for HF emergency nets, well, HAMS do it all!
God bless, all on the group and on the air. Merry Christmas and Happy New Year! I hope to work many over the Holidays!

Very good! As I reported on high the radio pegged my 60 watt 144/440 meter into a dummy. So it may even put out more than 61 watts on VHF. I didn't bother to check the other power settings until my friend who has a Marconi Instruments Aeroflex test set returns. He's currently swamped right now as he's an FCC certified avionics repair tech working a couple hundred miles away in a town working on Bendix, Collins, Rockwell, Honeywell etc.. avionics. When he gets home he promised to spec out the radio an give my the good (or bad news.) We'll then know how well the Chinese designed the transmitter and receiver. As far as the software goes it may have something to do with Windows 7 although 7 is old enough that the software should have no compatibility issues with it. I did a compatibility test and Windows 7 said run the software in the XP Service Pack 3 mode. That did not prevent crashes. I swear I could upload frequency pairs no problem. But when I went into the set menu
to add my call sign to the welcome menu the cursor moved erratically when I tabbed through the six
fields and when I went to write this I get some string error 9. So the software is little use to me. Fortunately I have most of the repeater pairs programed in and I'm familiar enough with the menu system and the
owner's manual to get to the custom setting I want without using the software. Only thing is I will be able to write it to the computer for a backup, but I won't be able to write it back to the radio in case i have to reset the radio. I do have one template that will write back to the radio that will save some
time but for me that software is buggier than batsh/t. If I could get the driver for the Prolific USB cable
in .inf and .sys form I could do a direct update to make 100% I have the right driver. But Qixiang decided to put it in an executable exe file that doesn't do much good if you've had previous Prolific
devices. My old Radio Shack uses a Prolfic driver and the cable doesn't care it grabs the first driver it sees. Maybe I can expand that exe file and extract the drivers out of it. Been a while since I tried that stuff.

Subject: [Anytone_AT-588UV] Arrived today!

Unit is as Milt stated in all respects. I won't repeat it all here. The receiver is very sensitive, I tried the NWS freqs just as a lark and could copy Gainsville, GA and Gwood, SC FB. I can hit the Gwood repeater with 10 watts and was told my audio was awesome. That repeater is over 80 air miles away. (I live in Henderson Co. NC abt 15 air miles south of Asheville) I have not set the compander as I have no background noise. After a 20 minute QSO on 2 meters the heatsink was barely warm and no fan. Audio report was well the ham said "You are where, running how many watts!?" And the audio is STRONG!

I have only been in it (the radio/program) for abt 45 mins so I will dig deeper and update. The hookup was easy (I have a dedicated XP machine) and I just plugged the adapter in, selected the comm port and read and wrote to the radio. I run my HF on this computer too with HRD and my scanner and my HT.

I am looking forward to all the updates and input as we learn about this new radio. I'd like to thank Ed for his determination and fine work. I know he jumped through many hoops and probably pulled a few hairs out in this. It's great Ed! And hats off to you and yours, ya did good! I have had many radios in 32 years and cannot see anything to complain about here. Thanks to all in the group and on the air too. Having beena net control and net manager for HF emergency nets, well, HAMS do it all!

God bless, all on the group and on the air. Merry Christmas and Happy New Year! I hope to work many over the Holidays!

488. REMOTE the HEAD 25ft? RE: [Anytone_AT-588UV] Arrived today!

From: Walt Tolpa
Topic: 479 Message: 488

This is all very exciting. Quick question, I would need to remote the head 25 feet from the body. Would this be a problem?? I would operate in the house and want to minimize coax cable losses. I was thinking buying off the shelf RJ-45/Cat5 cable pre wired and plug and play. Suggestions?

Red, blue, and green with various intensities should, in theory, make any color you desire. (Think RGB monitor.) Yellow is red plus green. Try knocking down the unwanted blue, and play with around with red and green to get the shade you want.

First of all I'd like to say that the radio firmware reports the model being QX588UV.QX being the manufacturer Qixiang Electron Corp. Production date as reportedby the radio is 11-28-2012.
I measured power output using a 50 watt dummy load and a meter designed for 144/440.Tests was conducted on a 40 watt continuous duty Diamond GZV4000 @ 13.8 VDC. Currentdraw at full power on 2 meters was 10 amps.On 440 power output was 30 watts. On 144 power was 61 watts. The power didn't deviatein the commercial / public bandspace.
I couldn't get ahold who has a Marconi Aeroflex test set to really dive into the receiver sensitivitybut I did work a
repeater about 50
miles away on 2 meters and received it full quieting with a 20 over 9signal. A .70 cm repeater about 20 miles away gave me a 10 over 9 with just an alligator test lead stuckin the S0239 on the back of the radio so the radio has excellent ears. Audio quality is above averagebut there are some barely noticeable artifacts in the audio when both sides of the radio are receiving asignal. And it's only noticeable at very quiet volume levels. And these artifacts only appear on a certain combination of frequencies most notably uhf on one side and vhf on the other. I do like the speaker mic.It's almost as lit up as my Christmas tree but you can dim it and the pushbuttons around the display usinga function setting. The LCD display has three colors and 32 levels of intensity to choose from in many possiblecombinations. Blue at the max setting of 32 and green at 32 and red at 28 gave me the brightest shade of blue. So there is really no way to have the pictured amber display. The microphone indicates which side of the radio is active for making changes and transmitting. Under the keypadthe A B indicators illuminate as to the active band. Above the keypad the A B indicators illuminate green for rx andred for tx so the only thing the mic is missing is a frequency display LOL! I have not tried the speaker in the mic yet.
I asked a friend to come over and talk to me on the AT588UV while I went mobile with the Yaesu FT8900. I thought the AT588UV sounded great even without the compandor enabled. And I did some heat tests also. I talked simplexfor some time to a friend
about 25 miles away. I noticed the heat sink was warm to the touch but the fan hadn't turnedon. So I went back on dummy load and held the key down for 60 seconds. By that time my 50 watt dummy load was gettingalmost too hot to touch (this was on 2 meters) but the dummy load has fins on it so I wasn't worried about it too much. The heatsink on the radio was still warm to the touch but no fan. So I transmitted another 60 seconds at 61

watts and finallygot some fan action. But to tell the truth the heatsink was luke warm although it did start to warm up a little right away at the beginningof my test. That tells me there is good thermal transfer between the output mosfet and the heatsink.
Ok now for the not so good things :-(
Squelch. There is some odd interaction between sides of the radio and specific frequencies that cause the squelchto open or the
signal meter to deflect fully on a non CTCSS decode channel. This seems to be more prominent whenyou are monitoring ham and public service bands. I upped the squelch levels on each side using the software and thatseems to eliminate 99% of this oddity. Squelch is factor set for 4 on both sides.Software. QPS588UV version 1.0. What a joke. I was lucky to upload a few repeaters and
some police departmentsinto the radio and save that template so I could have something to fall back on. But it seems as if when I read datafrom the radio then try to change function settings and write them to the radio I get an error 9 string something or other. When you close that out and exit the write, the program crashes and disappears. Also
the Prolific 2032 chipped cable likes to grabthe first driver it sees. As an avid user of USB to serial devices I had no less than 4 drivers for Prolific on my system. Noneof them mentioned for the 2032 device so I chose the latest date driver and it worked. The driver software is part of the programming software and you install it separately. And if you have other
versions of Prolific drivers and the USB cable grabs one of those first and it doesn't work, hopefully you'll have the savvy to correct the driver version issue. You shouldinstall the software first, then go to the software folder and run the UsBtoComPort.exe file, that installs the driver. Then you can plug your USB cable in and hopefully it will install the right driver.
So other than the squelch/signal meter oddity, and the fact that the display seems to be lit byonly one led on the right side I'll have to still give it an 8 out of 10.

I don't see a problem. I frequently use my Alinco HF rig with removable head on 25 feet of CAT5 jumper with no side affects. It certainly can't harm the radio. I haven't tried my 588UV yet with that jumper but will do it for you here in just a little bit and report back.

Subject: Re: REMOTE the HEAD 25ft? RE: [Anytone_AT-588UV] Arrived today!

I don't see a problem. I frequently use my Alinco HF rig with removable head on 25feet of CAT5 jumper with no side affects. It certainly can't harm the radio. I haven'ttried my 588UV yet with that jumper but will do it for you here in just a little bitand report back.

Subject: REMOTE the HEAD 25ft? RE: [Anytone_AT-588UV] Arrived today!

This is all very exciting. Quick question, I would need to remote the head 25 feet from the body. Would this be a problem?? I would operate in the house and want to minimize coax cable losses. I was thinking buying off the shelf RJ-45/Cat5 cable pre wired and plug and play. Suggestions?

Subject: [Anytone_AT-588UV] Arrived today!

Unit is as Milt stated in all respects. I won't repeat it all here. The receiver is very sensitive, I tried the NWS freqs just as a lark and could copy Gainsville, GA and Gwood, SC FB. I can hit the Gwood repeater with 10 watts and was told my audio was awesome. That repeater is over 80 air miles away. (I live in Henderson Co. NC abt 15 air miles south of Asheville) I have not set the compander as I have no background noise. After a 20 minute QSO on 2 meters the heatsink was barely warm and no fan. Audio report was well the ham said "You are where, running how many watts!?" And the audio is STRONG!

I have only been in it (the radio/program) for abt 45 mins so I will dig deeper and update. The hookup was easy (I have a dedicated XP machine) and I just plugged the adapter in, selected the
comm port and read and wrote to the radio. I run
my HF on this computer too with HRD and my scanner and my HT.

I am looking forward to all the updates and input as we learn about this new radio. I'd like to thank Ed for his determination and fine work. I know he jumped through many hoops and probably pulled a few hairs out in this. It's great Ed! And hats off to you and yours,

ya did good! I have had many radios in 32 years and cannot see anything to complain about here. Thanks to all in the group and on the air too. Having beena net control and net manager for HF emergency nets, well, HAMS do it all!

God bless, all on the group and on the air. Merry Christmas and Happy New Year! I hope to work many over the Holidays!

Already tried it, if you get close to an amber-ish color it's too dark. Remember these are LED lights and don't follow the rules of RGB color mixing because the red is more of a purple. Besides I don't like amber anyway. Sent from my 15.4" MacBook Pro i7 quad core OS X Mountain Lion

"The LCD display has three colors and 32 levels of intensity to choose from in many possiblecombinations. Blue at the max setting of 32 and green at 32 and red at 28 gave me the brightest shade of blue. So there is really no way to have the pictured amber display."
Red, blue, and green with various intensities should, in theory, make any color you desire. (Think RGB monitor.) Yellow is red plus green. Try knocking down the unwanted blue, and play with around with red and green to get the shade you want.

First of all I'd like to say that the radio firmware reports the model being QX588UV.QX being the manufacturer Qixiang Electron Corp. Production date as reportedby the radio is 11-28-2012.
I measured power output using a 50 watt dummy load and a meter designed for 144/440.Tests was conducted on a 40 watt continuous duty Diamond GZV4000 @ 13.8 VDC. Currentdraw at full power on 2 meters was 10 amps.On 440 power output was 30 watts. On 144 power was 61 watts. The power didn't deviatein the commercial / public bandspace.
I couldn't get ahold who has a Marconi Aeroflex test set to really dive into the receiver sensitivitybut I did work a

repeater about 50
miles away on 2 meters and received it full quieting with a 20 over 9signal. A .70 cm repeater about 20 miles away gave me a 10 over 9 with just an alligator test lead stuckin the S0239 on the back of the radio so the radio has excellent ears. Audio quality is above averagebut there are some barely noticeable artifacts in the audio when both sides of the radio are receiving asignal. And it's only noticeable at very quiet volume levels. And these artifacts only appear on a certain combination of frequencies most notably uhf on one side and vhf on the other. I do like the speaker mic.It's almost as lit up as my Christmas tree but you can dim it and the pushbuttons around the display usinga function setting. The LCD display has three colors and 32 levels of intensity to choose from in many possiblecombinations. Blue at the max setting of 32 and green at 32 and red at 28 gave me the brightest shade of blue. So there is really no way to have the pictured amber display. The microphone indicates which side of the radio is active for making changes and transmitting. Under the keypadthe A B indicators illuminate as to the active band. Above the keypad the A B indicators illuminate green for rx andred for tx so the only thing the mic is missing is a frequency display LOL! I have not tried the speaker in the mic yet.
I asked a friend to come over and talk to me on the AT588UV while I went mobile with the Yaesu FT8900. I thought the AT588UV sounded great even without the compandor enabled. And I did some heat tests also. I talked simplexfor some time to a friend
about 25 miles away. I noticed the heat sink was warm to the touch but the fan hadn't turnedon. So I went back on dummy load and held the key down for 60 seconds. By that time my 50 watt dummy load was gettingalmost too hot to touch (this was on 2 meters) but the dummy load has fins on it so I wasn't worried about it too much. The heatsink on the radio was still warm to the touch but no fan. So I transmitted another 60 seconds at 61 watts and finallygot some fan action. But to tell the truth the heatsink was luke warm although it did start to warm up a little right away at the beginningof my test. That tells me there is good thermal transfer between the output mosfet and the heatsink.
Ok now for the not so good things :-(
Squelch. There is some odd interaction between sides of the radio and specific frequencies that cause the squelchto open or the
signal meter to deflect fully on a non CTCSS decode channel. This seems to be more prominent whenyou are monitoring ham and public service bands. I upped the squelch levels on each side using the software and thatseems to eliminate 99% of this oddity. Squelch is factor set for 4 on both sides.Software. QPS588UV version 1.0. What a joke. I was lucky to upload a few repeaters and
some police departmentsinto the radio and save that template so I could have something to fall back on. But it seems as if when I read datafrom the radio then try to change function settings and write them to the radio I get an error 9 string something or other. When you close that out and exit the write, the program crashes and disappears. Also
the Prolific 2032 chipped cable likes to grabthe first driver it sees. As an avid user of USB to serial devices I had no less than 4 drivers for Prolific on my system. Noneof them mentioned for the 2032 device so I chose the latest date driver and it worked. The driver software is part of the programming software and you install it separately. And if you have other
versions of Prolific drivers and the USB cable grabs one of those first and it doesn't work, hopefully you'll have the savvy to correct the driver version issue. You shouldinstall the software first, then go to the software folder and run the UsBtoComPort.exe file, that installs the driver. Then you can plug your USB cable in and hopefully it will install the right driver.

So other than the squelch/signal meter oddity, and the fact that the display seems to be lit byonly one led on the right side I'll have to still give it an 8 out of 10.

I can't answer that Walt. Not until more people receive their radio and use the software. I have a licensed disk for Windows XP that I might install on an older 2003 laptop I have just as a test. If the software still is buggy than it's the software. I've sat back and thought about it for the past hour and I doubt it has anything to do with the cable drive. Also I own a Netbook from Dell that is pretty much virgin. I know it has no Prolific USB drivers on it. I might install he 588UV software an Prolific driver and see what happens. Hell who knows there may be a conflict on my desktop since the install is so old. But all my other radio software rund perfect on that. Even the AEA PC Packratt 99 TNC software works fine. So at this point I just don't know what to tell you and everyone else. But in time we'll get it worked out. Having an IT Pro background helps me trouble shoot a lot of software/operating system problems. Back when I started we were switching over customers from 75 ohm cable Arcnet and TCNS to ethernet. And from Novell 3.11 and 4.xx over to NT4 and Windows 2000 server. And to do it on industrial clients that couldn't afford to have their system down for 5 minutes. So we installed the stuff parallel with their working DOS systems most employees having two monitors, keyboards, and computers on their desktop LOL!

Some questions:
1. How do you assign frequencies or channels to side A or B? Or do you use the same channel bank you set up in the "Normal Ch Edit" function.

2. What is the purpose of Hyper1 CH edit? Why is there a Hyper1 and Hyper2?

3. Do you mix the VHF and UHF channels in the "Normal CH Edit" setup function?

Already tried it, if you get close to an amber-ish color it's too dark. Remember these are LED lights and don't follow the rules of RGB color mixing because the red is more of a purple. Besides I don't like amber anyway.

"The LCD display has three colors and 32 levels of intensity to choose from in many possible
combinations. Blue at the max setting of 32 and green at 32 and red at 28 gave me the brightest shade of blue.
So there is really no way to have the pictured amber display."

Red, blue, and green with various intensities should, in theory, make any color you desire. (Think RGB monitor.) Yellow is red plus green. Try knocking down the unwanted blue, and play with around with red and green to get the shade you want.

First of all I'd like to say that the radio firmware reports the model being QX588UV.
QX being the manufacturer Qixiang Electron Corp. Production date as reported
by the radio is 11-28-2012.

I measured power output using a 50 watt dummy load and a meter designed for 144/440.
Tests was conducted on a 40 watt continuous duty Diamond GZV4000 @ 13.8 VDC. Current
draw at full power on 2 meters was 10 amps.
On 440 power output was 30 watts. On 144 power was 61 watts. The power didn't deviate
in the commercial / public bandspace.

I couldn't get ahold who has a Marconi Aeroflex test set to really dive into the receiver sensitivity
but I did work a repeater about 50 miles away on 2 meters and received it full quieting with a 20 over 9
signal. A .70 cm repeater about 20 miles away gave me a 10 over 9 with just an alligator test lead stuck
in the S0239 on the back of the radio so the radio has excellent ears. Audio quality is above average
but there are some barely noticeable artifacts in the audio when both sides of the radio are receiving a
signal. And it's only noticeable at very quiet volume levels. And these artifacts only appear on a certain
combination of frequencies most notably uhf on one side and vhf on the other. I do like the speaker mic.

It's almost as lit up as my Christmas tree but you can dim it and the pushbuttons around the display using
a function setting. The LCD display has three colors and 32 levels of intensity to choose from in many possible
combinations. Blue at the max setting of 32 and green at 32 and red at 28 gave me the brightest shade of blue.
So there is really no way to have the pictured amber display.

The microphone indicates which side of the radio is active for making changes and transmitting. Under the keypad
the A B indicators illuminate as to the active band. Above the keypad the A B indicators illuminate green for rx and
red for tx so the only thing the mic is missing is a frequency display LOL! I have not tried the speaker in the mic yet.

I asked a friend to come over and talk to me on the AT588UV while I went mobile with the Yaesu FT8900. I thought
the AT588UV sounded great even without the compandor enabled. And I did some heat tests also. I talked simplex
for some time to a friend about 25 miles away. I noticed the heat sink was warm to the touch but the fan hadn't turned
on. So I went back on dummy load and held the key down for 60 seconds. By that time my 50 watt dummy load was getting
almost too hot to touch (this was on 2 meters) but the dummy load has fins on it so I wasn't worried about it too much.
The heatsink on the radio was still warm to the touch but no fan. So I transmitted another 60 seconds at 61 watts and finally
got some fan action. But to tell the truth the heatsink was luke warm although it did start to warm up a little right away at the beginning
of my test. That tells me there is good thermal transfer between the output mosfet and the heatsink.

Ok now for the not so good things :-(

Squelch. There is some odd interaction between sides of the radio and specific frequencies that cause the squelch
to open or the signal meter to deflect fully on a non CTCSS decode channel. This seems to be more prominent when
you are monitoring ham and public service bands. I upped the squelch levels on each side using the software and that
seems to eliminate 99% of this oddity. Squelch is factor set for 4 on both sides.
Software. QPS588UV version 1.0. What a joke. I was lucky to upload a few repeaters and some police departments
into the radio and save that template so I could have something to fall back on. But it seems as if when I read data
from the radio then try to change function settings and write them to the radio I get an error 9 string something or other. When
you close that out and exit the write, the program crashes and disappears. Also the Prolific 2032 chipped cable likes to grab
the first driver it sees. As an avid user of USB to serial devices I had no less than 4 drivers for Prolific on my system. None

of them mentioned for the 2032 device so I chose the latest date driver and it worked. The driver software is part of the
programming software and you install it separately. And if you have other versions of Prolific drivers and the USB cable
grabs one of those first and it doesn't work, hopefully you'll have the savvy to correct the driver version issue. You should
install the software first, then go to the software folder and run the UsBtoComPort.exe file, that installs the driver. Then
you can plug your USB cable in and hopefully it will install the right driver.

So other than the squelch/signal meter oddity, and the fact that the display seems to be lit by
only one led on the right side I'll have to still give it an 8 out of 10.

Milton mentioned (in his detailed and well described initial report) some audio artifacts (on receive). I'd like to report an audio artifact on transmit... so that others can watch out for this and report if they notice it too.
You'll need a second receiver to listen to your own transmitted signal, or someone with very keen ears, used to listening to 2 way radio.

What I notice my rig does is occasionally, the transmit audio drops out in mid-syllable, the carrier remains on the air, but it's like audio was turned down to zero and then restores... Sometimes I start to Identify with "K" and the K get's blanked but the next several syllables or words even come through loud and clear. When having a normal conversation transmission, people on the opposite end have observed/counted as many as 15 to 20 momentary drop outs in the one transmission. This isn't a loose mic or intermittent mic type poor connection, it's something actually in the radio's modulation circuitry causing this. There is no 'scratchyness' sounding when it drops, as it would if it were a bad mic cord. The Radio can even be in transmitting with no CTCSS orDCS encoding and being listened to in Carrier squelch and still the audio can sporadically drop out for a syllable or more or less. So that eliminates the possiblity of tone deviation being too soft and covered over by voice modulation.
This is without Compander turned on, and with both Bands enabled on the radio, and the sub-Main Band is idle, not receiving anything at the time the audio drop outs were noted during transmit . Also doesn't matter if the Sub-band is being displayed or not.

I'd like to know if this behavior is unique to my rig, or they all have this tendency... heads up to listen for it and report back if you notice it.

Thanks

I've had something similar reported. A ramping up of the modulation during the initial PTT press. What I do is to press PTT and wait a second then speak. Seems to take care of the issue. As far as the modulation dropping further into the conversation that's not been reported and I asked the group I was speaking with last night including the repeater owner to listen for modulation anomalies. Didn't try the compander setting and it is not something that can be stored with the memory channel. I have reprogrammed my A button on the microphone to turn on or off the comp. I've spent the better part of 12 hours yesterday and this morning since 4 AM getting to know by memory the function select numbers and their various setting. Also talked on it last night for a solid 4 hours on high
power. The heat sink does get warm to the touch but mot alarmingly so. My Yaesu FT8900 you could almost boil water on it.
I've already figured out some quirks and work around so if you all want to ask me questions feel free. That's why I started this group :-)

Not sure about the Hyper edit but in the normal channel setup
you arrange the channels in the order you would like to select
them because they will appear on the main and sub band of the
radio in that order. Only time that there is a preference is when
you are in VFO mode. Then the right side of the radio prefers
UHF and the left VHF and you can only use the microphone direct
entry within those bands on the right or left side. I've been having
some problems making Selection changes with my software so I haven't
dived into it, I'm relying on manually setting the radio without a PC
which is actually pretty straight forward.

Some questions:
1. How do you assign frequencies or channels to side A or B? Or do you use the same channel bank you set up in the "Normal Ch Edit" function.

2. What is the purpose of Hyper1 CH edit? Why is there a Hyper1 and Hyper2?

3. Do you mix the VHF and UHF channels in the "Normal CH Edit" setup function?

It sounds like the audio is overdriven causing some clipping. Try the old method of holding the mic 2 - 3 inches away from your mouth and then turn the mic sideways so that you are talking across the face and not directly into it. If this doesn't help, it could also be the repeater's receive being too hot. I have noticed that some hams think they have to talk loudly and this also causes the clipping.

Just a suggestion. Good luck.

I'll work on the deviation tests once my buddy who owns the Marconi test set gets back home.
Also going to work on that 30 watt output on .70 cm. It should be 40. If we find a way to adjust
it I'll jack it up to 50 or as far as it can go. 440 repeaters around here are generally 15 miles away
from my usual circumference of travel anyway. Might as well get all out of the radio as possible
it's very well heat sinked and from the ABCD pads on the mike you can program any one of those
to mitigate the power output.

501. Follow up on testing

Yahoo group: Anytone_AT-588UV
Date: 2012-12-14 14:09:22 UTC
From: Milton Hywatt
Topic: 501 Message: 501

This weekend I will be putting the AT-588UV through a series
of tests on a friend's $25,000.00 Kenwood test set
and a $25,000.00 spectrum analyzer. This way I will be able to
detect any deviation from the stated specifications on my radio.
We will be scrutinizing the AT588UV on every level of receive
and transmit. The owner of the test gear noticed some anomalies
in the radio's transmit deviation as reported by others in this group.
He tells me some decreased levels in deviation is noticeable as I talk
but that he was being super critical and others probably would not
notice any difference. He has 42 years in communications electronics
and I spoke with him on his 2 meter and .70 cm repeaters this morning
while he was at home and then mobile for 45 minutes to a job he was doing.
So I trust this person's opinion on the transmitted audio. He made the
recommendation I bring the radio over to his place for tests. I'll also take
my Yaesu FT8900 and we will compare the results. I'll make them
available as soon as I have them. Oh, also he said with the compander
on the radio sounded like I had an Astatic D104E amplified mic on it.
And that he could hear room ambiance and a bit of echo. Now that is
exactly the opposite what the owner's manual states it should do LOL!
I guess it may sound different in the enclosure of a car but in this room
the sound is dampened pretty well with furniture and curtains so I don't
know where the echo comes from.

30 watts is a good amount for UHF - if the radio is rated for 40 I would live it there, you don't want to push the finals, even with great heat sinks like that.

Milton mentioned (in his detailed and well described initial report) some audio artifacts (on receive). I'd like to report an audio artifact on transmit... so that others can watch out for this and report if they notice it too.

You'll need a second receiver to listen to your own transmitted signal, or someone with very keen ears, used to listening to 2 way radio.

What I notice my rig does is occasionally, the transmit audio drops out in mid-syllable, the carrier remains on the air, but it's like audio was turned down to zero and then restores... Sometimes I start to Identify with "K" and the K get's blanked but the next several syllables or words even come through loud and clear. When having a normal conversation transmission, people on the opposite end have observed/counted as many as 15 to 20 momentary drop outs in the one transmission. This isn't a loose mic or intermittent mic type poor connection, it's something actually in the radio's modulation circuitry causing this. There is no 'scratchyness' sounding when it drops, as it would if it were a bad mic cord. The Radio can even be in transmitting with no CTCSS orDCS encoding and being listened to in Carrier squelch and still the audio can sporadically drop out for a syllable or more or less. So that eliminates the possiblity of tone deviation being too soft and covered over by voice modulation.

This is without Compander turned on, and with both Bands enabled on the radio, and the sub-Main Band is idle, not receiving anything at the time the audio drop outs were noted during transmit . Also doesn't matter if the Sub-band is being displayed or not.

I'd like to know if this behavior is unique to my rig, or they all have this tendency... heads up to listen for it and report back if you notice it.

Thanks

I think they were on simplex but again, back away from the mic and don't talk as loud and see what happens.

It sounds like the audio is overdriven causing some clipping. Try the old method of holding the mic 2 - 3 inches away from your mouth and then turn the mic sideways so that you are talking across the face and not directly into it. If this doesn't help, it could also be the repeater's receive being too hot. I have noticed that some hams think they have to talk loudly and this also causes the clipping.

Just a suggestion. Good luck.

Not sure about the Hyper edit but in the normal channel setup you arrange the channels in the order you would like to select them because they will appear on the main and sub band of the radio in that order. Only time that there
is a preference is whenyou are in VFO mode. Then the right side of the radio prefersUHF and the left VHF and you can only use the microphone directentry within those bands on the right or left side. I've been havingsome problems making Selection changes with my software so I haven'tdived into it, I'm relying on manually setting the radio without a PCwhich is actually pretty straight forward. Some questions:

1. How do you assign frequencies or channels to side A or B? Or do you use the same channel bank you set up in the "Normal Ch Edit" function.

2. What is the purpose of Hyper1 CH edit? Why is there a Hyper1 and Hyper2?

3. Do you mix the VHF and UHF channels in the "Normal CH Edit" setup function?

I noticed the same thing. I feel like its almost like an AGC style
muting. I put a constant tone on the radio with no issues. But if I
speak into the mic and wait too long between words or sentences it seems to
miss the first syllable.

Thanks very much for the reports, George and Milton!

Did you try programming TX frequencies *outside* the "NON-export" model's limits of 144~146 MHz and 430~440MHz?

When I tried entering my friend's 70 cm ham repeater with TX at 449.675, I get a "Frequency out of range" error from the software. This frequency is in the "Export" model's range of TX frequencies -- 136~174MHz and 400~490MHz. I was using tyhe QPS588UV version 1.0 software and Ed's fix.

Perhaps with a real connection, the software detects the Export model?

I am looking forward to getting mine!

Enjoy!

I suspect the audio artifacts on receive are due to phasing issues that most dual banders experience when listening to both sides of the radio.
One effective way of eliminating this is to use dual speakers wired 180 degrees out of phase with each other.
On most dual banders, you get muffling or a nearly muted sound when you listen to both sides of the radio at similar volume settings through a single speaker.
Two speakers wired opposite of one another eliminates this effect.

Milton mentioned (in his detailed and well described initial report) some audio artifacts (on receive). I'd like to report an audio artifact on transmit... so that others can watch out for this and report if they notice it too.
You'll need a second receiver to listen to your own transmitted signal, or someone with very keen ears, used to listening to 2 way radio.

What I notice my rig does is occasionally, the transmit audio drops out in mid-syllable, the carrier remains on the air, but it's like audio was turned down to zero and then restores... Sometimes I start to Identify with "K" and the K get's blanked but the next several syllables or words even come through loud and clear. When having a normal conversation transmission, people on the opposite end have observed/counted as many as 15 to 20 momentary drop outs in the one transmission. This isn't a loose mic or intermittent mic type poor connection, it's something actually in the radio's modulation circuitry causing this. There is no 'scratchyness' sounding when it drops, as it would if it were a bad mic cord. The Radio can even be in transmitting with no CTCSS orDCS encoding and being listened to in Carrier squelch and still the audio can sporadically drop out for a syllable or more or less. So that eliminates the possiblity of tone deviation being too soft and covered over by voice modulation.
This is without Compander turned on, and with both Bands enabled on the radio, and the sub-Main Band is idle, not receiving anything at the time the audio drop outs were noted during transmit . Also doesn't matter if the Sub-band is being displayed or not.

Manually entered by mic and programmed via software 152, 155, 460, 462 mhz no problem at all.

Hope that helps, more as I go. Today is my daughter's birthday so will play more tonight and tomorrow...

Since the VHF output pegs my 60 watt 144/440 specific meter, and the output device is likely the single Mitsubishi Electric device found in the Yaesu FT8900 that is rated 60 watts, I don't think it would do it any harm to run 60 watts on 440 mhz. I've got the use of a Kenwood high end test set and spectrum analyzer this weekend via another ham friend so we'll be going over this 588UV with a fine tooth comb. My biggest concerns so far are the carrier squelch and the roller coaster xmit deviation as you talk. The other bugs I've found aren't life threatening but in all honesty neither are the squelch and tx deviation. But since I'll have my hands on such a brute of a test set and someone who knows how to use it we'll see what gives and even match the 588UV against my Yaesu FT8900.

30 watts is a good amount for UHF - if the radio is rated for 40 I would live it there, you don't want to push the finals, even with great heat sinks like that.

I would probably try to refrain from bugging Ed about the radio. I've gone over the radio intensely and I started this group to handle all the technical questions saving Ed some time reading his 300 emails a day and answering technical questions on the phone while trying to procure, sell and ship them which in itself is no easy task. I would stick to the group, there are what 385 members now and some are starting to get their radios and I've had mine for two days now. I'm a fast learner and self taught electronics tech now partially retired do to health reasons. And I have ham friends that make a living with commercial UHF and VHF communications for law enforcement, local government, aviation etc so I have the means to document any discrepancies from the advertised performance and the FCC requirements of these radios. I'm hoping any input on our part of the more serious anomalies back to Qixiang Electron in China will result in some engineering changes and maybe a firmware upgrade although I don't know if that is possible with this radio. They usually try to protect any communications with the firmware so no stray input could corrupt it rendering the radio into a brick.

>Milton mentioned (in his detailed and well described initial report) some audio artifacts (on receive). I'd like to report an audio artifact on transmit... so that others can watch out for this and report if they notice it too.
>You'll need a second receiver to listen to your own transmitted signal, or someone with very keen ears, used to listening to 2 way radio.
>
>What I notice my rig does is occasionally, the transmit audio drops out in mid-syllable, the carrier remains on the air, but it's like audio was turned down to zero and then restores... Sometimes I start to Identify with "K" and the K get's blanked but the next several syllables or words even come through loud and clear. When having a normal

conversation transmission, people on the opposite end have observed/counted as many as 15 to 20 momentary drop outs in the one transmission. This isn't a loose mic or intermittent mic type poor connection, it's something actually in the radio's modulation circuitry causing this. There is no 'scratchyness' sounding when it drops, as it would if it were a bad mic cord. The Radio can even be in transmitting with no CTCSS orDCS encoding and being listened to
in Carrier squelch and still the audio can sporadically drop out for a syllable or more or less. So that eliminates the possiblity of tone deviation being too soft and covered over by voice modulation.
>This is without Compander turned on, and with both Bands enabled on the radio, and the sub-Main Band is idle, not receiving anything at the time the audio drop outs were noted during transmit . Also doesn't matter if the Sub-band is being displayed or not.

Has anyone who has the 588UV with the FCC and serial # stickers tried to use a mono plug external speaker? I get some audio but also get a low frequency squeal. It was my understanding that if a mono plug was used both VHF and UHF would output on a mono plug to a single speaker. I can get VHF only if I use a stereo plug using the tip and sleeve and the audio is loud and clean.

Thanks very much for the reports, George and Milton!
Did you try programming TX frequencies *outside* the "NON-export" model's limits of 144~146 MHz and 430~440MHz?
When I tried entering my friend's 70 cm ham repeater with TX at 449.675, I get a "Frequency out of range" error from the software. This frequency is in the "Export" model's range of TX frequencies -- 136~174MHz and 400~490MHz. I was using tyhe QPS588UV version 1.0 software and Ed's fix.
Perhaps with a real connection, the software detects the Export model?
I am looking forward to getting mine!
Enjoy!

The range of frequencies I can direct enter from the mic keypad in VFO mode are:
On the left side of the radio 108 - 180 mhz, and on the right side 400 - 532 mhz
I could not direct enter either 220 or 350 on either right or left side from the keypad.
But they can be entered into the software and then written to the radio. Maybe there is
a step I'm missing in manually setting up 220 and 350, I don't know but like I said they
can be programmed into channels in software then written to the radio.

Firstly I'd like to extend my public condolences and message of support to all those affected by the tragic events of Newtown Connecticut.

Jeff,
Yes, I agree with your description, very much like a heavy AGC noise blanker or VOX type action cutting out more often on the first syllable or a syllable which occurs after a pause in a normal conversation transmission.

I've also noticed an interesting "cross-talk" between sub-bands when both are set to a 2m freq. Example:

If the left side is on a 2m freq. and the right side on a 440Freq. then you change the right side to a 2m freq (different from the left side) the left side squelch opens and you have an S meter signal presentation of a couple of bars. Clearly there is some interaction between the two receivers but it always seems to affect the left side, never the right side, and this doesn't happen if you try this with two 440 freq.s What's more once this cross-talk begins even if you change the right band back to a 440 freq, the left side is still showing a signal and blowing squelch noise... you can clear it by transmitting on the left side band.

Actually Milton, the compander function (as mentioned rather poorly in the manual) is only meant to be used when talking to other similar radio(s) with THEIR compander(s) turned on. This no different than any other commercial radio equipped with Companders... Kenwood TK series, Motorola CDM series all offer companding for use on 12.5Khz NFM, the point being to restore some of the audio 'punch' or loudness that has been removed by operating in half the channel bandwidth. It only works correctly tho, if both radios on either side of the conversation have their companders on and they are both of the same style of radio which means their audio processing works in the same way. If you listen to a non-companded receive signal on your radio with the compander turned on, you'll notice it sounds horrible, over-processed, not of correct volume, even distorted. It needs to be 'de-companded' by your radio's compander processor to make it sound more normal. It all has to do with shaping audio into a specific format or envelope that fits within the 12.5Khz channel, and then it is expanded back to something more normal by the receiving radio's compander processer.

Incidentally the word compander was dreamed up to describe an audio processing ckt that does both compression (on transmit direction) and expansion (for the receive direction).

From: nczman
Topic: 521 Message: 521

I got it to cross band repeat. Was kind of frustrating tho. First I could not figure out the 4th step. Said to press the Main band selector knob, the radio prompt "DU" (?) and the LCD displays "RPT". Not sure what they mean by the Radio Prompt DU. It is cross band repeating, but "RPT" is not showing on the screen.

Am I doing something wrong?

Thanks

Randy

The cross-talk can be virtually eliminated if you use RF squelch on either both sides or on the left side of the radio. I noticed this right off the bat and played around with it yesterday. I turned both carrier squelches off and set the RF squelch on both sides to S9.

RF squelch set to S9?!? By my understanding you've just made the radio as insensitive as it can go... That's not really a very good fix... Is that what it took to silence the cross talk?

Well the selection jumps from S5 to S9. S5 wasn't quite enough. Then after finding out the left side of the
radio seemed to start the cross talk I moved the VHF frequency over to the right and backed the squelch
down the S5. But the radio worked fine at S9. I was able to receive repeaters that were no where near full
quieting. And today I'm operating it with the sub band off displaying only a volt meter. I had to cancel my
trip to the Kenwood test set today but will get over to its location Sunday. There are definitely some specs
that I want to scope out just to make sure the radio isn't doing anything funny (or funnier) like transmitting
spurs. I also want to look at this issue with a gated transmit deviation.

I think it would be good to know what the hit on radio sensitivity is when you turn on the RF Squelch and set it to any of it's settings. I'm willing to bet that S9 (and full bar) are a noticeable degradation when using the test set as a calibrated signal source.

Yeh I couldn't make it to the test set's location today but tomorrow
afternoon looks good. And the person who owns it knows how to
operate it, they can get very complicated and I imagine something
as new as this set has a high learning curve to learn how to operate it.
As far as the sensitivity in the real use world goes an S9 setting would
be fine with me. I had a copy on a station that had enough fry noise
that it made it unpleasant to listen to. I'm not going to work a station
like that unless it was an emergency. And you can always hit the asterisk
button on the mic keypad and disable the squelch in a pinch.

Well, it is cross band repeating, but "RPT" is not showing.

any ideas?

If it's working as a crossband repeater I wouldn't worry if it lacked
RPT on the display. As soon as I get some time to set up a pair of
channels to use for crossband I'll post my results. I use crossband
all the time with a Yaesu FT8900. The only thing about the Yaseu
I don't care for is there is no way to identify your station on the channel you use
as in and out for the remote. And to operate 100% legit you need
a way to ID that transmission back to your HT or whatever other device
you are using. There are a couple radios that do a Morse ID but I
haven't read anything aout the AT588UV having the capability.

I did the factory reset and did not see the "RPT" on the screen at all. I wonder if it is a bug in the system. I also found what DU is. I found a post on someone's blog. They send an email back to the factory. DU is the beep. SO it really means to press the Main band selector and then the radio will come back with a beep. Also there are 2 different tones. One for when it is set and one for when it does not set to cross band. Not quite sure why it does not set, but I have ran into that a couple of times after changing frequencies for cross band and turning the cross band repeat function back on. Not sure why, but I get it to work again, by turning the radio off, then back on.

I was working with some other issues in the programming
software last night. It kept crashing in Windows 7 when
I would try to write to the radio. This PC happens to dual
boot Windows 7 and Windows Vista. So i set everything
up in Vista and the programming software works fine.
I would have never guessed that to be the case. As soon as
I'm able I'm going to set up cross band because I do use it
on VHF being on the fringe of a repeater I like.

What's happening is the first syllable or two are being limited.
As long as you keep talking without pausing it doesn't reoccur.
I was sent some audio files demonstrating how it sounds and
it is an annoyance since it does knock the modulation down
by about half for maybe 3/4 second. There may be a soft pot
adjustment to reduce the sensitivity of the circuit or to speed
up the recovery time so hang in there. Backing off the mic
to a couple inches and talking across the mic might help also.

536. High pitch whine on received audio?

Yahoo group: Anytone_AT-588UV
Date: 2012-12-17 00:40:10 UTC
From: w4jpl
Topic: 536 Message: 536

Today I was able to hook up my new AT-588UV, and I have the following comments.
I read some reports about how the heat sink doesn't get hot. Mine does, after just a few minutes of transmission. Not the end of the world.

But, on receive, there is a high pitch whine that is on the cusp of hearing, and is annoying.

After doing a little research on the net, I found this review by PD0AC

"RX audio is not very pleasant to listen to. There's such an amount of distortion that's is not something which is only measurable, but clearly audible. The audio amplifier also spits out a generous amount of noise, even when the volume is turned down to a minimum. On top of all this there's an annoying high pitched tone present when the squelch opens. My frequency counter, DSO, nor spectrum analyzer were able to isolate the frequency due to the reported noise and distortion. I eventually managed to pinpoint the frequency by tuning my function generator until both tones were zero beat. I ended up at 4000Hz, give or take a few Hz."

Does anyone have any comments, or perhaps a fix?

Thanks, John W4JPL

I noticed with mine, primarily on the UHV bands something I would not call a whine but rather a digital artifact. I've heard it before in other radios notably my Icom 706MkIIG. And there is some distortion at low volume, I'd call it more of a nuisance because I've heard a whole lot worse even coming from commercial communications gear costing $1000's of bucks. What I've done to correct the audio in the 588UV was to use a communications type external speaker. It also provides plenty of punch to the audio. You will need a stereo 3.5mm plug and use the right connection + sleeve to your mono speaker. As I sat in my home looking and listening for any anomaly I could I noticed that once in the SUV, the audio issues were no longer an issue do in part to the ambient noise inside the cabin.

AM aircraft band sensitivity compares equally to my
Yaesu FT8900. A CAT5 cable will work to connect
the radio to the control head. I had hoped for a visit
with the Kenwood test set but it is busy making money
this evening. I've decided that the radio specs out well
against the FT8900 well except for a few anomalies.

From: John P. Lloyd
Topic: 536 Message: 540

I don't have an external speaker handy, (have a few somewhere) but I did plug in my bose headphones.
The whine was even louder.
I hear it on VHF and UHF equally.
I'm sitting here listening to a local repeater, and in the background I'm hearing all kinds of krap in the audio. I don't know how to describe it; chips and chirps.
Also, at low volume, the received audio has a lot of distortion in it. Turn up the audio and a lot of the distortion goes away (so it seems).
UGH.
I hope that there will be some sort of fix posted on this issue.

Between the whine and the transmit audio dropouts, at this point I would not recommend the purchase of one of these rigs until the issues get sorted out.

Hopefully these are user-fixable problems, or issues that will be fixed on future production runs.

I've had good success with the Baofeng and Wouxun HT's, and was expecting similar results from the AT-588UV

It's a pretty radio, but that's about it.
73, John W4JPL

I guess you forgot John that high fidelity speakers
have always been a no-no for communications.
With communications audio we want to narrow the
bandwidth so the frequency response is only as wide
as the response of a human voice. This especially
holds true with VHF and UHF and those using
CTCSS. My communications speakers both limit
the high end and low end so I don't hear PL tones
on the low end and equipment generated artifacts
both low and high.

Subject: Re: [Anytone_AT-588UV] High pitch whine on received audio?

I don't have an external speaker handy, (have a few somewhere) but I did plug in my bose headphones.
The whine was even louder.
I hear it on VHF and UHF equally.
I'm sitting here listening to a local repeater, and in the background I'm hearing all kinds of krap in the audio. I don't know how to describe it; chips and chirps.
Also, at low volume, the received audio has a lot of distortion in it. Turn up the audio and a lot of the distortion goes away (so it seems).
UGH.
I hope that there will be some sort of fix posted on this issue.

Between the whine and the transmit audio dropouts, at this point I would not recommend the purchase of one of these rigs until the issues get sorted out.

Hopefully these are user-fixable problems, or issues that will be fixed on future production runs.

I've had good success with the Baofeng and Wouxun HT's, and was expecting similar results from the AT-588UV

It's a pretty radio, but that's about it.

I noticed with mine, primarily on the UHV bands something I would not call a whine but rather a digital artifact. I've heard it before in other radios notably my Icom 706MkIIG. And there is some distortion at low volume, I'd call it more of a nuisance because I've heard a whole lot worse even coming from commercial communications gear costing $1000's of bucks. What I've done to correct the audio in the 588UV was to use a communications type external speaker. It also provides plenty of punch to the audio. You will need a stereo 3.5mm plug and use the right connection + sleeve to your mono speaker. As I sat in my home looking and listening for any anomaly I could I noticed that once in the SUV, the audio issues were no longer an issue do in part to the ambient noise inside the cabin.

Subject: [Anytone_AT-588UV] High pitch whine on received audio?

Today I was able to hook up my new AT-588UV, and I have the following comments.
I read some reports about how the heat sink doesn't get hot. Mine does, after just a few minutes of transmission. Not the end of the world.

But, on receive, there is a high pitch whine that is on the cusp of hearing, and is annoying.

After doing a little research on the net, I found this review by PD0AC

"RX audio is not very pleasant to listen to. There's such an amount of distortion that's is not something which is only measurable, but clearly audible. The audio amplifier also spits out a generous amount of noise, even when the volume is turned down to a minimum. On top of all this there's an annoying high pitched tone present when the squelch opens. My frequency counter, DSO, nor spectrum analyzer were able to isolate the frequency due to the reported noise and distortion. I eventually managed to pinpoint the frequency by tuning my function generator until both tones were zero beat. I ended up at 4000Hz, give or take a few Hz."

Does anyone have any comments, or perhaps a fix?

Thanks, John W4JPL

so has anyone played around with routing audio to the speaker in the mic, and the speaker in the radio and the various combinations there in?
These phasing/artifact issues, are they minimized at all by routing the left and right sides of the radio to different speakers etc?
How is the audio from the microphone speaker? tinny and gross as one might expect, or decent for the size?

AM aircraft band sensitivity compares equally to my Yaesu FT8900. A CAT5 cable will work to connectthe radio to the control head. I had hoped for a visitwith the Kenwood test set but it is busy making moneythis evening. I've decided that the radio specs out wellagainst the FT8900 well except for a few anomalies.

As far as not using a speaker that is not strictly a communications speaker or my Bose headphones, I'll guess we'll have to agree to disagree.
Restricted "communications" quality audio is fine for ssb, but I expect a more pleasant receive audio on fm, such as comes out of the "big three" and also Alinco fm radios I own.
I've been using VHF fm for over 30 years now, and this reminds me of the first series vx1's that yaesu came out with. That ht made my ears bleed until yaesu fixed the problems, which they did.
Using a restricted speaker is only hiding or masking noise artifacts that should not be there in the first place.

As far as the speaker in the mic, it is actually not so bad, a little restricted, but is plagued by the same krap in the audio as the internal speaker.

Ed needs to step up and address these issues before bringing any more of these in.

From: KENT
Topic: 546 Message: 546

Hello All

Below is a link from a guy who did a review of the Pre-Release version of this radio
'
It seems to me that these issues still exist in the radios people have received from the production run!!

Not too encouraging yet!

73 de Kent

This morning I put a bird wattmeter and a 50 ohm load on the radio and found the following
2m 52 watts
440 30 watts

The rig gets hot after about 5 minutes of 50/50 use 2m simplex use.
The somewhat noisy fan then comes on and remains on for some time.
The rig does not seem to get excessively hot

I agree with Milton, ED is really busy right now plus I'm sure he has other personal stuff going on.

As far as not using a speaker that is not strictly a communications speaker or my Bose headphones, I'll guess we'll have to agree to disagree.
Restricted "communications" quality audio is fine for ssb, but I expect a more pleasant receive audio on fm, such as comes out of the "big three" and also Alinco fm radios I own. I've been using VHF fm for over 30 years now, and this reminds me of the first series vx1's that yaesu came out with. That ht made my ears bleed until yaesu fixed the problems, which they did.
Using a restricted speaker is only hiding or masking noise artifacts that should not be there in the first place.

As far as the speaker in the mic, it is actually not so bad, a little restricted, but is plagued by the same krap in the audio as the internal speaker.

Ed needs to step up and address these issues before bringing any more of these in.

Subject: Re: [Anytone_AT-588UV] High pitch whine on received audio?

I don't have an external speaker handy, (have a few somewhere) but I did plug in my bose headphones.
The whine was even louder.
I hear it on VHF and UHF equally.
I'm sitting here listening to a local repeater, and in the background I'm hearing all kinds of krap in the audio. I don't know how to describe it; chips and chirps.
Also, at low volume, the received audio has a lot of distortion in it. Turn up the audio and a lot of the distortion goes away (so it seems).
UGH.
I hope that there will be some sort of fix posted on this issue.

Between the whine and the transmit audio dropouts, at this point I would not recommend the purchase of one of these rigs until the issues get sorted out.

Hopefully these are user-fixable problems, or issues that will be fixed on future production runs.

I've had good success with the Baofeng and Wouxun HT's, and was expecting similar results from the AT-588UV

It's a pretty radio, but that's about it.

I noticed with mine, primarily on the UHV bands something I would not call a whine but rather a digital artifact. I've heard it before in other radios notably my Icom 706MkIIG. And there is some distortion at low volume, I'd call it more of a nuisance because I've heard a whole lot worse even coming from commercial communications gear costing $1000's of bucks. What I've done to correct the audio in the 588UV was to use a communications type external speaker. It also provides plenty of punch to the audio. You will need a stereo 3.5mm plug and use the right connection + sleeve to your mono speaker. As I sat in my home looking and listening for any anomaly I could I noticed that once in the SUV, the audio issues were no longer an issue do in part to the ambient noise inside the cabin.

Subject: [Anytone_AT-588UV] High pitch whine on received audio?

Today I was able to hook up my new AT-588UV, and I have the following comments.
I read some reports about how the heat sink doesn't get hot. Mine does, after just a few minutes of transmission. Not the end of the world.

But, on receive, there is a high pitch whine that is on the cusp of hearing, and is annoying.

After doing a little research on the net, I found this review by PD0AC

"RX audio is not very pleasant to listen to. There's such an amount of distortion that's is not something which is only measurable, but clearly audible. The audio amplifier also spits out a generous amount of noise, even when the volume is turned down to a minimum. On top of all this there's an annoying high pitched tone present when the squelch opens. My frequency counter, DSO, nor spectrum analyzer were able to isolate the frequency due to the reported noise and distortion. I eventually managed to pinpoint the frequency by tuning my function generator until both tones were zero beat. I ended up at 4000Hz, give or take a few Hz."

Does anyone have any comments, or perhaps a fix?

Thanks, John W4JPL

I did some more testing in the real world.
The AT-588UV is actually more sensitive on AM
air than my Yaesu FT8900. Once I can get some time
at the local radio shop and their Kenwood test analyzer
I'll be able to put the radio through it's paces and document
it's performance.

AM aircraft band sensitivity compares equally to my
Yaesu FT8900. A CAT5 cable will work to connect
the radio to the control head. I had hoped for a visit
with the Kenwood test set but it is busy making money
this evening. I've decided that the radio specs out well
against the FT8900 well except for a few anomalies.

If I use my Fostex studio grade headphones, my FT8900 sounds horrible. My FT60 sounds horrible the Anytone sounds horrible.

I can only relay to you my experience and that is a communications speaker band passes the PL tones and has a high cut so everything except normal voice is attenuated. And for me, it cuts the ever so slight buzz on UHF. I got the chance to listen to a Motorola Astro 800 MHZ trunked radio on a system using a Motorola Smartzone II APCO-25. Talk about some pops, buzzes and swooshes on some of the talk groups. I don't know if the Astro sounds like this normally or if there was something wrong with it. This was with the local FD and I was sitting in the chief's car who I happen to know personally. So I'm not trying to make excuses, this stuff occurs all the time in the real world.

The mic gain problem has been determined to
be the mic jack board. I'll be getting replacement
parts soon. I don't care for the internal speaker,
not even on my Yaesu FT8900 so I use an external
communications speaker. Audio is perfect on ext.
Receiver is fine, no "wide open" front end or intermod
although I'll no more when I can get to a friend's
Kenwood test set analyzer. So while it may seem to
you otherwise, after spending a week with the radio
the only problems that persists that would be annoyances
are the mic gain which I will get a chance to repair
and a birdie problem on certain VHF channels.

I'm curious…is the radio you are using from the first production run…or is it one of the pre-production prototypes?

I realize all of this info is very subjective at this point and I will very curious to hear your results from the professional testing you have access to!

I have pre-ordered this rig and still plan to take delivery but I certainly don't like the idea of having to open it up to make initial repairs that should have been remedied in the pre-production phase!

Thanks!

My radio was manufactured 11/28/12. It has a very low serial
number on it. None of the prototypes have serial numbers or are
FCC sticker'd. As far as having to repair the radio, I don't mind
replacing the mic jack. I am semi retired now, health reasons.
But spent the major part of 34 years in consumer electronic repairs
for major manufacturer warranty I have seen some real doozies.
In all types electronics. And I remember a while back buying
a Yaesu monoband that was so buggy I sent it back for a refund.
So there really is no drama for me in this.

557. An Idea.....

Yahoo group: Anytone_AT-588UV
Date: 2012-12-17 19:11:39 UTC
From: George Dunagin
Topic: 546 Message: 557

Ok one thought may help. Lets list what we have i.e. mine is as follows:
Anytone AT-5888UV noted on the upper right front of the radio and on a sticker on the heat sink by the power cord/ SN 0790A121200013 FCC sticker on the left side of the heat sink. No where does it say AT-588UV.

So far, I have heard none of the mentioned problems but of course they could appear and I will report them promptly. Sensitivity is great, sound our of the radio speaker is crisp and sharp even in dual monitoring.

Maybe if we compare we can see some correlation.

I'm curious…is the radio you are using from the first production run…or is it one of the pre-production prototypes?
I realize all of this info is very subjective at this point and I will very curious to hear your results from the professional testing you have access to!
I have pre-ordered this rig and still plan to take delivery but I certainly don't like the idea of having to open it up to make initial repairs that should have been remedied in the pre-production phase!
Thanks!KentN8ZRD

It says AT588UV on the top of the faceplate. The firmare
identifies the radio as a QX588UD. Firmware dates the radio
11/28/12. So my radio is a very early model. There was mention
that the radio woud remain named AT588UV for sale in mainland

If you bought the cable you could download the current software
and reply back with what the radio firmware reports to the software.
And I was under the impression that the current software only worked
with the newest radios. For now I've got a radio that works the way I
want it to work. I should be getting a new mic jack board shortly, it looks
like it has some signal processing electronics on it. If so that should as
the Anytone technicians say fix the modulation limiting issue. I've heard
it and if it wasn't pointed out I might not notice it.

QSL, got that Milton, and I just finished a 30 min qso on 2 meters with 2 hams about 50 miles south of me via repeater and neither reported any problems. One asked what I was running and then where did I get it!? He said the audio was awesome. He then looked it up on Ed's site and said he'd be adding one to his collection real soon! He wondered if they were in stock, I can't advise....hope so.

George

It says AT588UV on the top of the faceplate. The firmareidentifies the radio as a QX588UD. Firmware dates the radio11/28/12. So my radio is a very early model. There was mentionthat the radio woud remain named AT588UV for sale in
mainland
If you bought the cable you could download the current softwareand reply back with what the radio firmware reports to the software.And I was under the impression that the current software only workedwith the newest radios. For now I've got a radio that works the way I want it to work. I should be getting a new mic jack board shortly, it lookslike it has some signal processing electronics on it. If so that should as the Anytone technicians say fix the modulation limiting issue. I've heard it and if it wasn't pointed out I might not notice it. Subject: [Anytone_AT-588UV] An Idea.....

Ok one thought may help. Lets list what we have i.e. mine is as follows:
Anytone AT-5888UV noted on the upper right front of the radio and on a sticker on the heat sink by the power cord/ SN 0790A121200013 FCC sticker on the left side of the heat sink. No where does it say AT-588UV.

So far, I have heard none of the mentioned problems but of course they could appear and I will report them promptly. Sensitivity is great, sound our of the radio speaker is crisp and sharp even in dual monitoring.

Maybe if we compare we can see some correlation.

My radio was manufactured 11/28/12. It has a very low serialnumber on it. None of the prototypes have serial numbers or areFCC sticker'd. As far as having to repair the radio, I don't mindreplacing the mic jack. I am

semi retired now, health
reasons. But spent the major part of 34 years in consumer electronic repairsfor major manufacturer warranty I have seen some real doozies. In all types electronics. And I remember a while back buying a Yaesu
monoband that was so buggy I sent it back for a refund. So there really is no drama for me in this.

I'm curious…is the radio you are using from the first production run…or is it one of the pre-production prototypes?
I realize all of this info is very subjective at this point and I will very curious to hear your results from the professional testing you have access to!
I have pre-ordered this rig and still plan to take delivery but I certainly don't like the idea of having to open it up to make initial repairs that should have been remedied in the pre-production phase!

Great to see all the comments on the new radio. I ordered on November 19th so mine should be hear any day. I guess the good thing about it not being here, I am getting great insight on what to look for.

Ron,

Sure thing and so far so good, I have in 32 years seen many worse problems than those reported (horror stories) dealing with well established rigs that cost tons more. So far there is nothing negative to report on this unit. And I did see an article from an ARRL writer referencing an HF rig in the $500.00 range. Will be nice to watch for. I am constantly amazed at some of the prices even on used gear. I would almost never pay close to retail on a rig that is used but I see it done all the time. My specialty is now homebrewing antennas and if I can work through pile ups on HF with 100 watts, it must be working. What makes me laugh is the few who run 1.5 kw to rag chew on say 40 meters and all I hear is "Man, this thing is swinging!" hihi. IF a person wants to run an amp to make contacts, the first 500-600 watts is the icing, the rest is negligible. But of course this is just my opinion. But it's good to get a signal report on 100 watts that is equal to or better than someone running the legal limit. And to hear those that some can't hear. Old adage "For every dime one spends on the rig, spend a dollar on the antenna." It is true. Ok, off my soapbox for now.

569. Mic Jack Replacement Pictures

Yahoo group: Anytone_AT-588UV
Date: 2012-12-17 21:35:32 UTC
From: Milton Hywatt
Topic: 569 Message: 569

I uploaded two pictures in /Files/Pictures of the replacement mic jack that will fix the modulation issue. Looks like it's got some electronics on it maybe for gain limiting and buffering but I can't be sure without any service literature. Hopefully for hams like me that can repair these things some service literature will become available soon. This new jack looks fairly straight forward to replace. One cable to plug into the control head. You'll need a set of small Torx drivers for the screws on the control head.

The idea is to limit what goes on air to conserve bandwidth, You simply cannot expect broadcast audio these days when the FCC is shrinking the bands. I suggest you take a realistic approach into today's VHF signals and the mandates manufactures have to engineer into their radios. And I 200% disagree with you on the speakermic. That has all sorts of artifcats assuming from the control head processor.. It's usable but much more noise.

The audio amplifier also spits out a generous amount of noise, even when the volume is turned down to a minimum. On top of all this there's an annoying high pitched tone present when the squelch opens. My frequency counter, DSO, nor spectrum analyzer were able to isolate the frequency due to the reported noise and distortion. I eventually managed to pinpoint the frequency by tuning my function generator until both tones were zero beat. I ended up at 4000Hz, give or take a few Hz."

In spite of my typo on the date, I would have waited on Ed anyway. I did not want to order from overseas and did want to order from someone who is trustworthy and Ed is certainly that. I am not saying others aren't and they very well may be but Ed has been around a long time and is known and trusted by many.

Here is a copy of the email I received 12-16 from Ed at Import Communications . I ordered mine on Dec 4.73Kent

Anytone was scheduled to ship an order yesterday and another on Tuesday. I'll get all orders filled as soon as they arrive.

My Rig is a QX588UV, manufactured on 11/28/12
V1.00
On the faceplate it is a AT-588UV
So, I expect that my radio is from the same batch as Milton's.
What is interesting is that his radio type ends with a D, and mine ends with a V.

One other interesting thing that I noted is that I tried the rig in cross band repeat mode; there is NO transmitted audio dropout, so perhaps the fix of the new mic jack will remedy the audio dropout problem.

I've had no issues running the software with Windows 7. What I did do was to unplug all of the other USB to serial cables.
I'm running a sony laptop.

Meant to say So my radio isn't a very early model
according to the firmware date.

Sent from my 15.4" MacBook Pro i7 quad core OS X Mountain Lion

Sent: Monday, December 17, 2012 2:32 PM
Subject: Re: [Anytone_AT-588UV] An Idea.....

It says AT588UV on the top of the faceplate. The firmare
identifies the radio as a QX588UD. Firmware dates the radio
11/28/12. So my radio is a XXXXXXXX. There was mention
that the radio woud remain named AT588UV for sale in mainland

If you bought the cable you could download the current software
and reply back with what the radio firmware reports to the software.
And I was under the impression that the current software only worked
with the newest radios. For now I've got a radio that works the way I
want it to work. I should be getting a new mic jack board shortly, it looks
like it has some signal processing electronics on it. If so that should as
the Anytone technicians say fix the modulation limiting issue. I've heard
it and if it wasn't pointed out I might not notice it.

Subject: [Anytone_AT-588UV] An Idea.....

Ok one thought may help. Lets list what we have i.e. mine is as follows:
Anytone AT-5888UV noted on the upper right front of the radio and on a sticker on the heat sink by the power cord/ SN 0790A121200013 FCC sticker on the left side of the heat sink. No where does it say AT-588UV.

So far, I have heard none of the mentioned problems but of course they could appear and I will report them promptly. Sensitivity is great, sound our of the radio speaker is crisp and sharp even in dual monitoring.

Maybe if we compare we can see some correlation.

Subject: Re: [Anytone_AT-588UV] An Idea.....

My Rig is a QX588UV, manufactured on 11/28/12
V1.00
On the faceplate it is a AT-588UV
So, I expect that my radio is from the same batch as Milton's.
What is interesting is that his radio type ends with a D, and mine ends with a V.

One other interesting thing that I noted is that I tried the rig in cross band repeat mode; there is NO transmitted audio dropout, so perhaps the fix of the new mic jack will remedy the audio dropout problem.

I've had no issues running the software with Windows 7. What I did do was to unplug all of the other USB to serial cables.
I'm running a sony laptop.

Sent: Monday, December 17, 2012 2:32 PM
Subject: Re: [Anytone_AT-588UV] An Idea.....

It says AT588UV on the top of the faceplate. The firmare
identifies the radio as a QX588UD. Firmware dates the radio
11/28/12. So my radio is a XXXXXXXX. There was mention
that the radio woud remain named AT588UV for sale in mainland

If you bought the cable you could download the current software
and reply back with what the radio firmware reports to the software.

And I was under the impression that the current software only worked
with the newest radios. For now I've got a radio that works the way I
want it to work. I should be getting a new mic jack board shortly, it looks
like it has some signal processing electronics on it. If so that should as
the Anytone technicians say fix the modulation limiting issue. I've heard
it and if it wasn't pointed out I might not notice it.

Subject: [Anytone_AT-588UV] An Idea.....

Ok one thought may help. Lets list what we have i.e. mine is as follows:
Anytone AT-5888UV noted on the upper right front of the radio and on a sticker on the heat
sink by the power cord/ SN 0790A121200013 FCC sticker on the left side of the heat sink.
No where does it say AT-588UV.

So far, I have heard none of the mentioned problems but of course they could appear and I
will report them promptly. Sensitivity is great, sound our of the radio speaker is crisp
and sharp even in dual monitoring.

Maybe if we compare we can see some correlation.

580. Want some cheese with your whine?

Yahoo group: Anytone_AT-588UV
Date: 2012-12-18 22:50:05 UTC
From: Milton Hywatt
Topic: 580 Message: 580

I've come to the conclusion the radios audio circuit
is not properly equalized on the high end. This allows
artifacts in the audio to be heard when they should be
suppressed. And I'm also convinced that the scintillation
being perceived as distortion is part of this. If I recall
correctly frequencies beyond a certain point can merely
be passed to ground by a non polar low value electrolytic
capacitor as used in a L-C configuration of a static speaker
crossover. I'm going to experiment with some values tomorrow
and see if I can drop the frequency response down below
10 khz. The whine seems to be close to that because I did
run the audio into a Yamaha 16 band equalizer and was able
to eliminate the whine by dropping the gain right around 10khz.
Had i been able to hook up last weekend with my friend and his
test set/spectrum analyzer, I wouldn't have to needed to experiment
the traditional way I know, I would have been able to see the
audio artifacts on screen at the frequencies they were being detected
upon. Well so much for now, I'm working on these tweaks because
I don't care for them either.

581. Editing power output and such

Yahoo group: Anytone_AT-588UV
Date: 2012-12-19 15:41:58 UTC
From: Stuart
Topic: 581 Message: 581

Question for you folks who already have these rigs in your hot little hands.... I was wondering if there are any user-accessible adjustments inside these mobiles for things like freq, dev, and power output. The power output part is because of the applications where one would like to be able to limit RF output to 2 watts, like on what used to be splinter channels for LPI repeaters and control stations, or for MURS. I realize these aren't Type Accepted for Part 95, but the radios fairly beg to be put on MURS, as long as the power could be set down to 2 watts, I would think.

The commercial tech side of me (rather than the ham and ex-public safety user sides) also wonders if things like the master oscillator has a coil with a "for real" adjustable coil or capacitor for netting onto frequency. Then my mind sorta wanders to setting(s) for deviation for the three TX bandwidths. Then further wanderage occurs, and I start thinking about editing the burst tone frequencies, for maybe remote control of linked repeaters, etc.

I'd emailed Ed @ import several weeks ago to ask if there was a separate alignment software available for these radios, in case all the parameters about which I was wondering were adjusted via "Softpots", à la Motorola's RSSs. Ed opined at the time that, if there were such a software, it would probably not be made available.

I can check with the factory, but I thought it'd be simpler first to ask folks here if they'd already seen likely adjustments inside the radio.

Since I keep my bench gear in cal, it'd bug me no end if a transmitter were substantially off-freq and I had no way to rectify it (pun intended). Even if it's on-freq, it'd still be nice to be able to modify power levels and tones, unless they're already addressable in the user software. From what I see in the software, they're not, but I could be wrong.

Speaking of bandwidth -- sorry my post is so long, but anyone got any ideas?

tnx es 73

583. Comments about the Radio..

Yahoo group: Anytone_AT-588UV
Date: 2012-12-19 21:30:00 UTC
From: Mark Thomas.
Topic: 583 Message: 583

Hello Anytone,

I programmed the radio, put it online next to my other rigs and did some testing...

One thing I wish they would allow is,, Scanning of one band,, while the cross band repeater is active..
I like to monitor two or three repeaters while I am out and about in the yard, etc.. where I can't hit the repeater with a hand held..
I wonder if this could be allowed,, and possibly be a firmware update,, or a tweak in the software...
It would really make the radio more useful..

Also, I have tested against my other cross band repeater.. Seems this one's signal drops quite a bit when crossbanding.. Much more than my Alinco did..
Has anyone compared this crossband repeater to another to see if this is common to yours also?

Um, you have to do it yourself, unless you want to share your Yahoo password with some random stranger.

See the group link (http://groups.yahoo.com/group/Anytone_AT-588UV/)below. Click on the visit your group on the web link, and log in with your Yahoo password.

See where it says Edit Membership up near the top right of the page? Click on it.

Down towards the bottom left of the page see where it says Leave Group? You might have to scroll down and to the right if it's off the page.

Click on Leave Group. Follow any instructions it gives you (I don't want to leave, so I'm not going to try that part).

There's always http://lmgtfy.com/?q=leave+yahoo+group if you need more help. Good Luck!

Kirk, KC8MMU

Subject: [Anytone_AT-588UV] Editing power output and such

Question for you folks who already have these rigs in your hot little hands.... I was wondering if there are any user-accessible adjustments inside these mobiles for things like freq, dev, and power output. The power output part is because of the applications where one would like to be able to limit RF output to 2 watts, like on what used to be splinter channels for LPI repeaters and control stations, or for MURS. I realize these aren't Type Accepted for Part 95, but the radios fairly beg to be put on MURS, as long as the power could be set down to 2 watts, I would think.

The commercial tech side of me (rather than the ham and ex-public safety user sides) also wonders if things like the master oscillator has a coil with a "for real" adjustable coil or capacitor for netting onto frequency. Then my mind sorta wanders to setting(s) for deviation for the three TX bandwidths. Then further wanderage occurs, and I start thinking about editing the burst tone frequencies, for maybe remote control of linked repeaters, etc.

I'd emailed Ed @ import several weeks ago to ask if there was a separate alignment software available for these radios, in case all the parameters about which I was wondering were adjusted via "Softpots", à la Motorola's RSSs. Ed opined at the time that, if there were such a software, it would probably not be made available.

I can check with the factory, but I thought it'd be simpler first to ask folks here if they'd already seen likely adjustments inside the radio.

Since I keep my bench gear in cal, it'd bug me no end if a transmitter were substantially off-freq and I had no way to rectify it (pun intended). Even if it's on-freq, it'd still be nice to be able to modify power levels and tones, unless they're already addressable in the user software. From what I see in the software, they're not, but I could be wrong.

Speaking of bandwidth -- sorry my post is so long, but anyone got any ideas?

tnx es 73

I have several radios that cross band repeat and I don't think any of them will let you scan while the cross band repeater is active..

just because you decrease power out on a non type accepted radio
does not make it legal. doing such a thing could cost someone his license. stuart states "
i realize these aren't Type Accepted for Part 95", this is beyond making adjustments. i
would question any ham making adjustments on any radio capable of operating outside of ham
bands, this requires a commercial license if i recall.

You are opening one big can-o-worms to ask that question.

Many people will say that unless you abide by the FCC
rules, you can ONLY use part 95 radios.

Many people say that you can use what ever radio you want
because it's 1 in a 840,893,332
chance that the FCC will come knocking on your door to
examine your equipment.

Most will say, if a radio is part 90 certified, there is no
reason to not use it in part 95.

here is a copy of part 95
http://www.unwantedemissions.com/47cfr/current/47CFR095.pdf

Please note MURS and GMRS are both part 95, but
the radio's have NOTHING to do with each other.

IF I get a 588, it will be programed to amateur, some public
service and
most likely all eight GMRS channels.

it's even easier than that.
send an email with no subject line to:
anytone_at-588uv-unsubscribe @ yahoogroups . com without the spaces
simply type the word "unsubscribe" and the email address that you are receiving list messages at into the body of the email and send it. Quotes free of course.
Yahoo will respond asking you if you really want to unsubscribe, again, simply reply directly without writing anything and you'll be free and clear.
Unsubscribing, and subscribing to yahoo groups is about the simplest and most thought free process on the internet these days lol.

regards
Colin

Hello Mike, This is my reply to your below listed message to me.

Thanks Mike.. It is a feature that would really be handy.. Seems like it would be easy to do,, just an after thought..
I can only hit a couple of repeaters from the bottom of the Gorge,, but like to keep track of the guys on them.. I can't even think about hitting them with the handy talky,,unless I climb the Mountain I keep looking at.. thinking.. There are some really big deer on top of that mountain,, but,, it is a really good place to be hiding from me up there...
Would be really nice to be able to scan and listen to what is going on,, instead of listening to one frequency all day while I am working...

Thanks for the info.. Maybe someone will consider it one day.. I'll start looking for this feature when I run across the dual band repeaters..
That is one feature I would pay extra for..

Thanks guys..

Best regards,

Mark

This is slightly off topic, but I believe that if you were to use 2 mobiles and one of the Radiotone simplex repeaters, i believe that this would be possible, as (dont hold me to this) i believe that they take the audio being output by the radio and use that to feed into the TX radio, since they dont directly interface with the radio, at least at a software level. So i believe that if you were to scan with the RX radio that it would transmit whatever the radio hears into the TX radio. Now this would require having 2 radios, but alot of us have 2 anyways, and the repeater is somewhere in the 100-150 dollar range i believe.

Hello Brandon, This is my reply to your below listed message to me.

Yes, I looked at the Radiotone simplex repeaters.. They record audio, and then play it back over the radio they are hooked to..
There is a quick video of it here: http://www.youtube.com/watch?v=ANNCn3zXFQ0
That would work, but, the delay might pose a problem with the scanning. But, an interesting concept.

I have a VHF radio and a VHF/UHF in the same area. Also have two beam antennas that will work VHF/UHF.. One is a Cushcraft 2 meter 13 element beam,, just happens to tune nicely to the UHF band, and an arrow dual band beam 4 element. They are about 25 feet apart, each on its own support pole.. One about 4 feet higher than the other.. I'm not sure how far apart I would have to put them, for them not to interfere with each other,, or maybe it would be more of a height issue,, but,, they interfere with each other...

Even when one radio is not being used,, or even turned on for that matter,,, when you rotate one of the beams,, it enhances or degrades the signal of the other.. If both are pointed at the same angle,,, they work really well,, turn one 45 degrees off of the other, and they both degrade severely..

It would be better if there was a cross band repeater that scanned during repeat mode,, to simplify my problems anyway..
But thanks for the tought... I need to get one of the antennas about 10 feet higher than the other and test them again.. I think vertical height is more important than the horizontal distance between the two antennas... But,, here in the gorge,, down between two mountains,, sometimes I can point the beam directly at the ground (gravel and rock), and get just as good of a signal,, as pointing in the pocket in the mountain across the river, or down the mountain..

When I go out with my handheld, and a hand held beam,, I find the best reception pointing at the back side of a 24 foot camper trailer, where the signal seems to reflect back off of the trailer.. But, have to transmit down the river in a bend,, to bounce the signal out of here.. It's amazing how much the signals bounce off of things around here... I can't talk to my Mom across the street,, her antenna about 250 feet away,, on the local repeater.. Too much interference of the signal,, even if my beam is pointed away from her place..

I could really use a 400 foot tower down here.. Ha..Ha.. but,, I do Ok with the beams and bouncing.. HF works great,, but,, the low angle signals coming in on 10meters don't exist.. Seems like 10m is always dead,, until I get in my truck and drive out of the Gorge...

Cheers..

Best regards,

Mark

This is slightly off topic, but I believe that if you were to use 2 mobiles and one of the Radiotone simplex repeaters, i believe that this would be possible, as (dont hold me to this) i believe that they take the audio being output by the radio and use that to feed into the TX radio, since they dont directly interface with the radio, at least at a software level. So i believe that if you were to scan with the RX radio that it would transmit whatever the radio hears into the TX radio. Now this would require having 2 radios, but alot of us have 2 anyways, and the repeater is somewhere in the 100-150 dollar range i believe.

Why would you want the radio to scan in crossband? Unless you are at the radio you would have no control over it. You could only talk when someone else talked first to stop the scan. Also, if the radio was in scan mode and you wanted to talk, you would have no control over what frequency it transmits on. Every amateur radio that I knows of drops out of scan as soon as you talk on it and you can't originate a transmission until it's out of scan.

Perhaps if this was a $1000 radio it might be remotely possible but people want Mercedes Benz features for a Hyundai price.

That being said, there is the legal ramifications of properly identifying, interfering with other stations because it was in scan, etc, but I won't even take the conversation there.

This whole discussion about "cross band repeat" mystifies me.
I have had a radio that is capable of "cross band repeat"
for around 20 years
and have only found two times where I used "cross band
repeat", and I don't think
they were legal, I "repeated" the local airport "uni-com"
channel to some obscure
channel in the amateur UHF band. This was just so I could
hear what was going on the
uni-com while working at a small local airshow.

I can't see why this is so important that it need to takes
so much bandwidth on this group.
Why don't someone start another group "cross-band repeat" or
something,
to get the traffic off this group.

Thanks

Don

601. Head Bracket Update ..

Yahoo group: Anytone_AT-588UV
Date: 2012-12-20 19:16:39 UTC
From: advancedspec
Topic: 601 Message: 601

Hello!
Just a heads-up .....
We were just informed, 48 hours ago, By AnyTone, that the remote head bracket is "not yet ready" ..
They are planning to ship our (& most likley other USA Dealers) initial radio orders next week, & are planning to send the ordered faceplate brackets at a later time, when available.
They are to let us know within the next couple of days if the faceplate bracket can be made ready in time to ship with the radios, they are trying hard, but they don't want to delay shipping the USA AT-5888UV orders due to waiting for faceplate brackets.

602. Re: Editing power output and such

Yahoo group: Anytone_AT-588UV

From: Stuart
Topic: 581 Message: 602

Don,
Thanks for the thoughtful post, and the link to the Part 95 regs.

In the interest of not offending the tender sensibilities of the folks who were unable to read my entire first post, in which I mentioned that I'm also a commercial tech AND that there are legitimate Part 90 applications for a 2-watt output, and a desire to make sure that my >$1,000-per-year in calibration certificates for all my bench gear get put to good use, I stand by my *technical* query about knowledge of onboard adjustments for traditional transmitter parameters.

I did not intend for this subject to have attracted proselytizing wannabes who jump on any chance to play Junior FCC Enforcement Agents, or to impugn my morality based upon a technical question that gave an example.

So my original question, sans the Part 95 section, stands, if anyone has seen the inside of one of these units or has other specific info on the software.

Thanks in advance to the levelheaded amongst you, and 73.

Stuart (50 year ham, 40 year commercial ticket)

Hello ke7ejf, This is my reply to your below listed message to me.

Well,, if it is scanning in Crossband,, let say,, monitoring two local repeaters that can't be hit from my location on a hand held.. Can't receive or Transmit to them... Scan functions usually have three distinct types..
One stops when it receives for a specified period of time.
Next stops and stays where it last received a signal

Next pauses as long as there is traffic on the frequency...

I would choose the later.. And,, if I knew there was a time limit to the scan, I would know before it broke back into scan.. The only time it might start scanning against my will would be if the signal receiving didn't come in fast enough... But,, since it is only scanning two or three channels,, maybe I might miss a word,, maybe two...

If for some reason, I transmitted later in the game,, I might transmit on another repeater which I support... I doubt that would happen because it would be up to me if that happened,, knowing the time out before scan...

I'm not sure how the radio works exactly on scan,,, never thought about it.. But,, when you key up,, it definitely stops.. Is it watching for voltage from the keydown,, or watching the internals for the Cross Band Transmit,, I don't know.. I guess I never thought about that..
Maybe someone more familiar with the scan functions,, maybe someone who wrote some firmware might have that answer.. Or,, could be tested easily if a radio came across that had the function.. I guess that is why I was asking.. To see if anyone else had a radio that had the function.

I work with several clubs within an hour or so drive from here.. Not that far, but takes a while in the mountains to get around..
Without me standing at my base unit, I don't get a chance to keep up with the folks,, unless it is a Net Checkin.. I talk to guys on several repeaters as regular as I can, but, I stay busy and stay moving.. Mostly on my property here, since this is where my business is..

Like I said,, if I could locate a radio with the function,, I would spend the money for it.. But,, it doesn't hurt to try inexpensive radios,, and make recommendations to those who don't have the money to spend on name brand rigs.. I was the first to try the Wouxuns and Baofengs in my area,, and lots of both of those radios sold because of it..

I am familiar with identifying, interfering etc,, but,, using the radio as I intend to use it,, is all within operating parameters,, as long as the transmissions are within the ham band.. I also have a Business Band repeater here, and I have to monitor it full time..

You probably can't relate to this,, but,, the maximum range of the repeater,, all with good equipment (Vertex VX7000 Repeter) properly tuned, good antenna, etc.. only reaches 7.5 miles one way and 1.5 miles the other..

And getting to the local repeaters is only possible by bouncing signals down through the gorge..

Since I read the emails in reverse,, I did get to read Don and Kent's replies..
So,, I hope both of you go back and read your comments, and read this email, and see why someone would use a Cross Band repeater,, and realize that you don't know everything,, and it should have made you wonder why Radios come with Cross Band Repeaters,, and people pay to have them,, and use them..
Maybe if you had thought about it for a few minutes,, you could have seen a use for them...

One other comment.. Maybe you are not familiar with working where signals are hard to get out.. Maybe you have never thought about being in a situation were handhelds were the only thing that could be used while addressing and emergency situation,, and there were just a few people involved in the Emergency,, all that had their hands full,, addressing loss of life, etc...
Like I said before.. Hand Helds in this area aren't going to connect to any kind of repeater... But,, click one button once,, and another twice,, and we could be hooked up to the local Ares Repeater, working with the Local EC,,, who would be relaying information to the proper services..
I guess maybe you are not aware that most police, sheriff and State Police in this area also have cross band repeaters in their vehicles for the same reason..
To be able to use handheld's, and use their patrol cars to get the signal out to the local repeater..
At least you can learn something from this thread that you did not know before...

Oh,, I'll go ahead and head the next comment off at the pass...
Why don't you use your Cellphone??? Ok,, maybe you don't know that there are still remote places in the USA where they don't work either.. This being one of them.. Oh Yes,, and if someone happens to be driving along with a Sat Phone,,,, well,, out of luck there too most likely..
I am one of the lucky ones that owns enough property to get close to the river with a dish,, and own the property the other side of the Highway,, and was willing to cut down some 100 foot plus towering trees to shoot between them,, to get Satellite coverage..

So,, sorry about the thread not meeting your expectations, and giving you reason to bash and shut it down.. I guess that is what Elmer'ing is all about these days?? The only question not asked is a stupid one..

Oh,, and BTW,, emails and bandwidth,, list servers, etc.. maybe you could brush up on that a bit too.. Maybe you aren't aware,, but,, emails are about the least bandwidth intensive usage of bandwidth,, but,, hey,, who would know that is today's multimedia world right??

Just one more thing to help you with your frustrations.. In every email, there is a Subject line...
This thread happens to have the subject: Re: [Anytone_AT-588UV] Re: Comments about the Radio..
If you are unhappy about the subject, and it does not interest you,, try this.. Whenever you see this subject,, IGNORE IT..
You never know if someone else might be reading that is interested in it.. But then again,, maybe you are part of the Mayan group, and have the telepathic skills to read all of our minds..

Sorry about the sarcasm,, but,, I try to spend my time reading, researching,, and helping others.. There's no telling how many times you turn people off from asking questions,, so you can be king of your little group...

Myself, My 74 year old Mother, 50 year old Girlfriend,, and one of my younger Employees all studied and took our Extra License Tests,, just to start up a local VEC Group, because the closest in the Area was 1.5 hours away.. We also offer every bit of our communications equipment and vehicles and resources,, including staff, to the local emergency group,, during natural disasters and emergencies..
Tell me,, what have you done for your community??

I guess that is what People are talking about, when they say,, the Radio Community need new blood in it.

I guess that is what you run into when you buy a Cheap Radio??? One here and there that can't afford anything else??
I don't consider my radios cheap stuff.. Just good radios at a good price.. In fact, because of it's weight and size,, I carry a Baofeng UV5R 24/7.. When I leave the Outpost and head out,, I grab my Wouxun with Diamond high gain antenna,, and take off..

I would be happy to drop off of this list if you can't figure out the Bandwidth issue,,and the Subject line delima that troubles you..
It seems like there are some pretty decent people here on the group.. I read just about every post on the group,, before I made my first comment..
Sorry that my need and interest in Cross band repeaters doesn't appeal to you.

And,, BTW,, I type about 80 words per minute,, so I didn't waste much time on your deserved reply..
Everyone have a nice day,, and thank you to those who did comment and share your knowledge with me and the others who were reading the posts..
Have a Great Day,, and Have a Great Holiday,, in case you don't like Christmas..

Best regards,

Mark

604. Re: [Anytone_AT-588UV] Re: Comments about the Radio..

Yahoo group: Anytone_AT-588UV
Date: 2012-12-21 01:10:40 UTC
From: Milton Hywatt
Topic: 583 Message: 604

Cross band repeating is a function of the radio. This group deals with the radio and all its functions. Cross band repeating touches some grey areas where the law is concerned. But if done within the confines of the amateur band plan and if the proper ID is made on the remote channel, it is legal unless someone can prove otherwise. Also remember this is an international group where what might not be legal in one country, it is in another.

As far as the volume goes, the bandwidth on this topic hasn't really gone viral yet. If it does I'll probably just end the topic. Those still wishing to follow up can always take the discussion off group.

From: Milton Hywatt
Topic: 583 Message: 605

Hi Mark, Milton here, owner of the group. I think we can
end the discussion about cross banding the radio. I've been
following the thread and realize you have a unique situation
calling for a radio with a unique way of operation. The AT588UV
just isn't that radio. Your solution may come with a couple radios
and a separate controller as mentioned prior. Or it may not. Regardless
I can see a trend in the thread that I don't care to see. So let's drop it
and move along. Any assistance I can be be feel free to email me.

Milt.

Subject: Re: [Anytone_AT-588UV] Re: Comments about the Radio..

Hello ke7ejf, This is my reply to your below listed message to me.

Well,, if it is scanning in Crossband,, let say,, monitoring two local repeaters that can't be hit from my location on a hand held.. Can't receive or Transmit to them... Scan functions usually have three distinct types..
One stops when it receives for a specified period of time.
Next stops and stays where it last received a signal
Next pauses as long as there is traffic on the frequency...

I would choose the later.. And,, if I knew there was a time limit to the scan, I would know before it broke back into scan.. The only time it might start scanning against my will would be if the signal receiving didn't come in fast enough... But,, since it is only scanning two or three channels,, maybe I might miss a word,, maybe two...

If for some reason, I transmitted later in the game,, I might transmit on another repeater which I support... I doubt that would happen because it would be up to me if that happened,, knowing the time out before scan...

I'm not sure how the radio works exactly on scan,,, never thought about it.. But,, when you key up,, it definitely stops.. Is it watching for voltage from the keydown,, or watching the internals for the Cross Band Transmit,, I don't know.. I guess I never thought about that..
Maybe someone more familiar with the scan functions,, maybe someone who wrote some firmware might have that answer.. Or,, could be tested easily if a radio came across that had the function.. I guess that is why I was asking.. To see if anyone else had a radio that had the function.

I work with several clubs within an hour or so drive from here.. Not that far, but takes a while in the mountains to get around..
Without me standing at my base unit, I don't get a chance to keep up with the folks,, unless it is a Net Checkin.. I talk to guys on several repeaters as regular as I can, but, I stay busy and stay moving.. Mostly on my property here, since this is where my business is..

Like I said,, if I could locate a radio with the function,, I would spend the money for it.. But,, it doesn't hurt to try inexpensive radios,, and make recommendations to those who don't have the money to spend on name brand rigs.. I was the first to try the Wouxuns and Baofengs in my area,, and lots of both of those radios sold because of it..

I am familiar with identifying, interfering etc,, but,, using the radio as I intend to use it,, is all within operating parameters,, as long as the transmissions are within the ham band.. I also have a Business Band repeater here, and I have to monitor it full time..

You probably can't relate to this,, but,, the maximum range of the repeater,, all with good equipment (Vertex VX7000 Repeter) properly tuned, good antenna, etc.. only reaches 7.5 miles one way and 1.5 miles the other..
And getting to the local repeaters is only possible by bouncing signals down through the gorge..

Since I read the emails in reverse,, I did get to read Don and Kent's replies..
So,, I hope both of you go back and read your comments, and read this email, and see why someone would use a Cross Band repeater,, and realize that you don't know everything,, and it should have made you wonder why Radios come with Cross Band Repeaters,, and people pay to have them,, and use them..
Maybe if you had thought about it for a few minutes,, you could have seen a use for them...

One other comment.. Maybe you are not familiar with working where signals are hard to get out.. Maybe you have never thought about being in a situation were handhelds were the only thing that could be used while addressing and emergency situation,, and there were just a few people involved in the Emergency,, all that had their hands full,, addressing loss of life, etc...
Like I said before.. Hand Helds in this area aren't going to connect to any kind of repeater... But,, click one button once,, and another twice,, and we could be hooked up to the local Ares Repeater, working with the Local EC,,, who would be relaying information to the proper services..
I guess maybe you are not aware that most police, sheriff and State Police in this area also have cross band repeaters in their vehicles for the same reason..
To be able to use handheld's, and use their patrol cars to get the signal out to the local repeater..
At least you can learn something from this thread that you did not know before...

Oh,, I'll go ahead and head the next comment off at the pass...
Why don't you use your Cellphone??? Ok,, maybe you don't know that there are still remote places in the USA where they don't work either.. This being one of them.. Oh Yes,, and if someone happens to be driving along with a Sat Phone,,,, well,, out of luck there too most likely..
I am one of the lucky ones that owns enough property to get close to the river with a dish,, and own the property the other side of the Highway,, and was willing to cut down some 100 foot plus towering trees to shoot between them,, to get Satellite coverage..

So,, sorry about the thread not meeting your expectations, and giving you reason to bash and shut it down.. I guess that is what Elmer'ing is all about these days?? The only question not asked is a stupid one..

Oh,, and BTW,, emails and bandwidth,, list servers, etc.. maybe you could brush up on that a bit too.. Maybe you aren't aware,, but,, emails are about the least bandwidth intensive usage of bandwidth,, but,, hey,, who would know that is today's multimedia world right??

Just one more thing to help you with your frustrations.. In every email, there is a Subject line...
This thread happens to have the subject: Re: [Anytone_AT-588UV] Re: Comments about the Radio..
If you are unhappy about the subject, and it does not interest you,, try this.. Whenever you see this subject,, IGNORE IT..
You never know if someone else might be reading that is interested in it.. But then again,, maybe you are part of the Mayan group, and have the telepathic skills to read all of our minds..

Sorry about the sarcasm,, but,, I try to spend my time reading, researching,, and helping others.. There's no telling how many times you turn people off from asking questions,, so you can be king of your little group...

Myself, My 74 year old Mother, 50 year old Girlfriend,, and one of my younger Employees all studied and took our Extra License Tests,, just to start up a local VEC Group, because the closest in the Area was 1.5 hours away.. We also offer every bit of our communications equipment and vehicles and resources,, including staff, to the local emergency group,, during natural disasters and emergencies..
Tell me,, what have you done for your community??

I guess that is what People are talking about, when they say,, the Radio Community need new blood in it.

I guess that is what you run into when you buy a Cheap Radio??? One here and there that can't afford anything else??
I don't consider my radios cheap stuff.. Just good radios at a good price.. In fact, because of it's weight and size,, I carry a Baofeng UV5R 24/7.. When I leave the Outpost and head out,, I grab my Wouxun with Diamond high gain antenna,, and take off..

I would be happy to drop off of this list if you can't figure out the Bandwidth issue,,and the Subject line delima that troubles you..
It seems like there are some pretty decent people here on the group.. I read just about every post on the group,, before I made my first comment..
Sorry that my need and interest in Cross band repeaters doesn't appeal to you.

And,, BTW,, I type about 80 words per minute,, so I didn't waste much time on your deserved reply..
Everyone have a nice day,, and thank you to those who did comment and share your knowledge with me and the others who were reading the posts..
Have a Great Day,, and Have a Great Holiday,, in case you don't like Christmas..

Best regards,
 Mark

Why would you want the radio to scan in crossband? Unless you are at the radio you would have no control over it. You could only talk when someone else talked first to stop the scan. Also, if the radio was in scan mode and you wanted to talk, you would have no control over what frequency it transmits on. Every amateur radio that I knows of drops out of scan as soon as you talk on it and you can't originate a transmission until it's out of scan.

Perhaps if this was a $1000 radio it might be remotely possible but people want Mercedes Benz features for a Hyundai price.

That being said, there is the legal ramifications of properly identifying, interfering with other stations because it was in scan, etc, but I won't even take the conversation there.

Hello Milton, This is my reply to your below listed message to me.

No problem Milton..
It takes time to moderate a group, without the fuss, and no sense in making it more difficult.

I asked what I considered a simple question,, got several good responses.
I thank the group for that..

FYI,, I have dealt with Qixiang Electron Science and Technology Co, Ltd. I bought a good load of stuff from them back in 2010..
When they came out with their FCC version of the ST-5189.. Back then,, they didn't even have a VHF version Handheld that was FCC.
The closest the had was the ST-3308 UHF FCC.. I just pulled their FCC file up from those purchases..

I recognized the Anytone Brand,, and decided to buy one,, because I was pretty satisfied with what I had gotten from the before, and most of the radios are still in use and had a fairly good track record..
I wanted a Cross Band repeater for reasons mentioned, but only needed one of them..

I live in one of the most beautiful place on this earth,, but,, for Internet, Satellite, and VHF/UHF, it is quite challenging. HF is no problem, until you get to the low angle DX signals on 10 Meters..
There is no better climate in the USA.. I've been everywhere. I had to buy a company to get land here.. One I very much enjoy running.

My Bio on QRZ has pictures I took from my front and side porch,, so you can see what issues I have getting to the local repeaters, only 12 to 15 miles away as the crow flies..

Sorry for the problem.. I don't subscribe to many lists like this, but thought since I was in on the first set of radios,, I thought this one might be interesting.
I have the radio programmed, understand the functions,, and only had that one question..

Good luck with your group..

Go ahead and Unsubscribe me.. I have other project and much more work to do in other areas... I just took some time off to play with the radio a bit, so I would be comfortable using it..

Nevermind.. I found the unsubscribe email address... It will be easier to let the computer do the work..
I setup a bunch of these on my own servers.. Once you get them setup,, they kind of take care of themselves,, unless you have people honking on each other.. But,, I have to say,, this is the first negative comment I have ever received from a fellow ham. Hmmm..

Best regards,

Mark

Topic: 609 Message: 609

So ... does anyone have a precise answer to this? It might take Ed to answer this question. Not looking for speculation, but the right answer!

The FCC will prohibit the manufacture and importation of radio equipment capable of wideband (25 kHz) operation after Jan. 1. Does this impact the Anytone AT-5888UV? Is it exempt because it operates also in narrowband mode?

If the importation rule applies to these radios, then this will be a serious setback for hams still stuck in their wideband ways. I'm hoping this radio will be available here after the first of the year. If not, I'm going to have to snatch one up very quickly!

Do you know for sure?

The mandate exempts amateur bands. The radio will perform
per Part 90 FCC on bands that are mandated for narrow operation.

Subject: [Anytone_AT-588UV] UV588 microphone pinout/capability?

Does anyone have any information if the microphone jack is compatible with any of the other manufacturers (for example, kenwood, and alinco use the same pinout)
Or
Does anyone have any mic pin out info for the UV588?

Merry CHRISTmas to all!

The way I read this, because this was "built" as an amateur
radio (Part 97)
they can still import them.
The only service involved in this mandate are radios for
use in Part 90.

Here are a couple links that should answer any narrow
banding questions you may have.

http://transition.fcc.gov/pshs/public-safety-spectrum/narrowbanding-faq.html
http://www.narrowband.us/

I have over 100 frequencies from my Wouxun that I'd like to duplicate on my future AnyTone, but the software for the AnyTone is awful and won't even allow a copy/paste.

My last attempt I got to memory number 10 and it crashed, so remember to save save save!

Has anyone found anything better, or other methods?

Thanks

I had a lot of crashes in Windows 7. Tried different compatibility modes
no luck. Every time I made a change I saved the change, that cured the
crashing but what a PITA. So I tried Windows Vista. My PC dual boots
both 7 and Vista. The program worked perfect in Vista. As far as copy
and past go, if you can copy it from your Wouxun software you can
paste it to the 588UV software. Just make sure the slot is highlighted
I guess I did that by double clicking, then hold CTRL + V to paste.
I was able to copy and paste from FT8900 commander. Unless there
is a hidden import from a CSV file somewhere, that's as sophisticated
as you're going to get with this version of the software.

Maybe someone can provide a radio to the Chirp developers so they can deconstruct the programming process for an integration. Chirping works with lots of different radios already and also CSVs.

You'll find that developing codeplug for different radios isn't so
much unlike the old saying that the "apple never falls far from the tree."

In my extended dialog with a programmer regarding SDR/CAT software
for the Alinco DX-SR8T all mode HF transceiver goes, that the basic
codeplug doesn't differ much from radio brand to the other. But that there
are always some modifications to the code needed to accomodate the
structures of the radio's NVRAM as adopted from not only radio model
to radio model, but from brand to brand. Wouxun had some problems
with using templates from older versions of its radios with the KGUV6D.
Using an earlier dated template could brick the radio because the memory
structure had been changed. And I can understand this a bit having programmed
basic rom and c/pm back in the good old days. Typically programmers choose
to code in Delphi, Visual Basic, C++ etc... Nothing I understand hell I couldn't
distinguish an ordinal from a subordinal. But you get what I'm saying. A lot
of coders work in their own time to develop free software for you. It gives them
a bit of gratification and some on the job learning helping them with their skills
in their livelihood allowing them to be more productive where the money actually is.

I've used the software several times with no problems whatsoever.
This morning, the thing would not read from the radio "com port will not open"
The comm was set to ten, and then when i plugged it into another usb port, it went to 11.
Thinking it might be an issue with the com port number, I researched how to reset the com port numbers:

http://www.youtube.com/watch?v=Cj5ukXLIzP8

Once I followed this fellow's instructions, it reset to com 3, and wala, it works fine now.
Hope this helps!

I found out that when it won't read from the radio (probably should always
read first and modify that data) that pulling the USB plug out and reinserting
in the same port fixes it. Windows uses a way to index USB ports per device
so if you plug it into the same port it's ready instantly. Problem is it saves device
issued com ports that you may no longer use. This is why Windows warns you
the com port is already in use when it isn't. I use a little program that tests cables.
It also scans com ports and reports back if the port is invalid (no device is using it)
or if the device is using the port but doesn't respond. Once you've determined that
there is no device on a com port you can force the device to instal on that port.
Haven't really looked for a way to clear the registry of past com port associations
with USB devices but that seems a bit better for those that might not understand the
process.

From: Walt Tolpa
Topic: 627 Message: 631

On my PC I had a dedicated USB port for my scanner. I now sold my scanner and want to dedicate this same USB port for the AT-5888UV. Will I have a problem now using this USB port for the 5888UV? If yes, how do I fix? Do I have to clear the rigister? How do I do that? Running Windows 7. Tnx.

Subject: Re: [Anytone_AT-588UV] Solution to get the software to work on windows 7

I found out that when it won't read from the radio (probably should always read first and modify that data) that pulling the USB plug out and reinserting in the same port fixes it. Windows uses a way to index USB ports per deviceso if you plug it into the same port it's ready instantly. Problem is it saves deviceissued com ports that you may no longer use. This is why Windows warns youthe com port is already in use when it isn't. I use a little program that tests cables.It also scans com ports and reports back if the port is invalid (no device is using
it)or if the device is using the port but doesn't respond. Once you've determined thatthere is no device on a com port you can force the device to instal on that port. Haven't really looked for a way to clear the registry of past com port associationswith USB devices but that seems a bit better for those that might not understand theprocess.

Subject: [Anytone_AT-588UV] Solution to get the software to work on windows 7

I've used the software several times with no problems whatsoever.

This morning, the thing would not read from the radio "com port will not open"

The comm was set to ten, and then when i plugged it into another usb port, it went to 11.

Thinking it might be an issue with the com port number, I researched how to reset the com port numbers:

http://www.youtube.com/watch?v=Cj5ukXLIzP8

Once I followed this fellow's instructions, it reset to com 3, and wala, it works fine now.

Hope this helps!

You shouldn't have problems. As long as you install the USB port software from the QPS588UV install BEFORE you plug the cable in. That's in program files/QPS588UV/ Set Com Port or something like that, not in front of my Windows PC right now. The Prolific USB to serial cable will often grab the first Prolific driver is can find or go to Windows Update and look there doing these for the most part in the background. However that driver will install and say it is working in Device Manager but won't work with the cable. So that's why it is imperative you install the drive bundled with the programming software first. Once installed, the radio plugged in and turned on start the programming software. It will require you to set the com port before the software will start. You can verify the port by going to control panel/ device manager/lpt and com ports and look for the Prolific device. Click on it then select properties and it should give you the port number. I'm describing this purely from memory but my information is accurate. You can always ask questions if you run into trouble and I will dust off the Windows 7 PC and walk you through it.

Greetings,

Been reading the posts and it seems the Anytone product is going to be far better than the Wouxun mobile that had so much promise!

I ordered mine on the 9th and patiently waiting the rig to show up before my vacation but it looks like it'll be a longer wait.

Cheers

Like any brand new product, the radio had some growing pains. I received one of the first 50 to roll off the assembly line and it had some issues with shielding within the control head. When I get around to it I'll beef up the shielding with some copper tape and maybe a few toroids on the serial data line from the control head to the radio. So as you can see with my lack of ambition, the issues are minor.

Hope you get your radio soon!

Milton, list owner.

The radio has no ability to receive FM broadcast. It can't receive below
108 mhz and doesn't have a wide enough bandwidth needed to parse
Fm broadcast.

Just an FYI
88 -108 Is FM broadcast (the radio does not cover this)

108--118 MHz: Air navigation beacons VOR
118--137 MHz: Air-band for air traffic control,
These Are AM and the manual said it covers these

Naturally, anything new will have some sort of bug(s) that would need some tweaking. I purchased a brand new FT-8900 and within 6 months I had issues that required to send off for repair. It's what we get with technology!

I'll spot my findings when I get the radio and spend some time with it. (Just don't tell my wife ha ha).

Happy Holidays,

N1YLJ

Yes, more information, please. Normally one sets a radio to "remote stun or kill" to disable another radio which is either being used in a manner that it is not supposed to be or one which has been stolen. This is usually accomplished by sending a specific set of tones.

Any further information you may provide would be helpful.

This radio has an undocumented (I've not been able to locate it) feature to turn it on or put it to sleep using DTMF tones. Great for a remote cross band repeater. Either I've read this somewhere or I've got the wrong radio.

A few of us out there are ready to buy Anytone. I guess next shipment will be in January to the US. When you open up the unit how is the workmanship?
Also does Anytone offer a warranty say for 12 months?
From what I have read the Wouxun dual bander now is pretty good however the Anytone offers AM aircraft and 220 RX. This is desirable if the 5888UV is reasonably well assembled

Suggestions?
Thanks

The radio's construction on a scale of 0 to 10 is about an 8.
And like any other new line of products made anywhere
in the world, the first to roll off the assembly line suffered
some growing pains. I remember when I first purchased
a Yaesu VX-5, I discovered a couple major flaws which
required opening the radio and making some modifications.
I'm sure there are plenty of other cases where other radio gear
have shared difficulties with the first run or two of the radio.
And you'll find that true with just about every manufactured goods.
As far as a warranty goes, you'll have to take that issue up with
whoever sold you the radio. And is the radio a keeper? Based
on the price, construction, and features yes but ultimately it's
you that has to make the choice. I for one would never talk
a person into or out of buying anything. But there is nothing wrong
with waiting awhile to get more input from other owners especially
when they received their radio, the serial number, and what they
think of their radio.

Subject: [Anytone_AT-588UV] Is the AT_5888UV a keeper or better to wait a few months?

A few of us out there are ready to buy Anytone. I guess next shipment will be in January to
the US. When you open up the unit how is the workmanship?
Also does Anytone offer a warranty say for 12 months?
From what I have read the Wouxun dual bander now is pretty good however the Anytone offers
AM aircraft and 220 RX. This is desirable if the 5888UV is reasonably well assembled

Suggestions?
Thanks

I agree 100% Personally I have used mine well and do not find anything negative of merit. I am truly happy with mine and as Milton noted there have been times when I bought top of the line, high dollar and was disappointed. I would buy it again, today.

I would buy from Ed though as I said he is reputable and will stand behind what he sells so there is no worries. Apparently there are some concerns about ordering from overseas direct and I agree, that is something to consider. BUt with dealers like Ed right here, well, no problem.

I do enjoy mine and am glad i have it.

The radio's construction on a scale of 0 to 10 is about an 8. And like any other new line of products made anywherein the world, the first to roll off the assembly line sufferedsome growing pains. I remember when I first
purchaseda Yaesu VX-5, I discovered a couple major flaws which required opening the radio and making some modifications. I'm sure there are plenty of other cases where other radio gearhave shared difficulties with the first run or two of the radio. And you'll find that true with just about every manufactured goods. As far as a warranty goes, you'll have to take that issue up withwhoever sold you the radio. And is the radio a keeper? Based on the price, construction, and features yes but ultimately it'syou that has to make the choice. I for one would never talk a person into or out of buying anything. But there is nothing wrongwith waiting awhile to get more input from other owners
especially when they received their radio, the serial number, and what theythink of their radio.

Hello,

at first, sorry for my bad English but I'm French.

I saw many post about some problem with audio RX and TX, but my english is to bad to understand all of them correctly.

I would like to know if it is a problem on the updated radio, or if it was only on the first one. A see that when TX, sometime the power of sound get down for the other, and when RX that the voice was sometimes bad. Moreover, it seem that when no RX and no TX, the radio still noisy.

What's about all of these, because it can be verry dammagable for my use in high mountain in bad waether condition. The 5 Tons is for me necessary, so the AT 5888 UV seem to be a good one !

Thanks for yours answers,

Jillian (French)

Pardonnez mon français. Il semble que quelques-unes des premières radios à quitter la ligne de production a eu quelques problèmes mineurs. Mais rassurez-vous que ces questions seront abordées. C'est une situation fréquente chez les nouveaux produits. Si vous achetez votre radio à un marchand qui se tiendra derrière le produit que vous garanti statisfaction.

100% Milton, and that is why I recommend a reputable dealer and one that is at least close by (in the USA). Yes those out of country may make good on your deal too but I think of the delay and cost in shipping time. If it were a $40.00 HT, well, no worries but this is not a $40.00 HT Nothing is perfect, no matter what but doing the best one can makes good sense.

Well, hard to say as mine never had those problems but I think Milton said mine was a later serial number and of course those made and shipped after mine would hive higher numbers still. I do know that say Ed's stock has been depleted totally more than once so all that he gets in should be newer. You could email him and ask and he will certainly advise you. info@importcommunications.com
Hope that helps :)

Would anyone know of a promotional code to use on Ed's site to order gear? I was hoping to save shipping cost or whatever.
Tnx.

Well, hard to say as mine never had those problems but I think Milton said mine was a later serial number and of course those made and shipped after mine would hive higher numbers still. I do know that say Ed's stock has been depleted totally more than once so all that he gets in should be newer. You could email him and ask and he will certainly advise you. info@importcommunications.com
Hope that helps :)

If you buy from a reputable retailer and agree that the radio
can be returned for a full refund if you are dissatified you should be ok. But
I cannot guarantee it, I'm not a retailer. If I was I certainly would
stand by my product and try to work towards a solution before
giving up and offering a refund.

From: electrician2000
Topic: 637 Message: 666

Sorry for the delay on this reply.
I was able to turn the remote kill on in the software. This is located in the DTMF menu on the right of the software. In there is a remote stun and remote kill option. On page 18 of the manual it talks about the remote kill and how to turn it on... But it does not tell how to turn it off. I left the radio powered off and disconnected for a day and was still unable to bring it back. I hope this helps answer the questions you had. I will be around to answers anything you can think of me to try.
Thanks
Nick

If the remote kill/stun is like the Motorola radios and you used some dtmf
code to remotely kill the radio then you would now have a paper weight.

in the manual that was posted here a while back, I remember the remote stun/remote kill thing and there was certainly a way to restore the radio after a remote kill was instigated.
perhaps via software only but it seems to me there was a method to get it running again.
So no, I don't think it's like other radios where the remote kill completely disables the radio for good.

Ok, Yaesu Vertex can be revived, as can the At588 single band. Have not seen but am looking for the procedure to do this on the AT-5888UV/AT588UV. I am reasonably sure this can be done. Yaesu/Vertex requires theirs to be sent to a service center. The 588 does not, I believe.

Have you asked your supplier yet and is there any power at all when you turn it on? Will keep looking,
George

Sorry for the delay on this reply.

I was able to turn the remote kill on in the software. This is located in the DTMF menu on the right of the software. In there is a remote stun and remote kill option. On page 18 of the manual it talks about the remote kill and how to turn it on... But it does not tell how to turn it off. I left the radio powered off and disconnected for a day and was still unable to bring it back. I hope this helps answer the questions you had. I will be around to answers anything you can think of me to try.

Thanks

Nick

Yes there is power when I turn the radio on and can see activity on my home channels. I am unable to change anything on the radio. I ahve tried sending the code again to unlock it but that did not work. I am trying to contact my supplier now to see if he has any ideas. I will try anything to figure it out. Hope that I do not have to send it back to the manufacturer to have fixed. That would take some time to ship.
THanks
Nick

Where did you get the manual you are looking at? I have one
for AT-588UV and it doesn't mention remote kill on page 18.
It goes over CTCSS setup, Sub band display and DTMF pre-load
delay time. I didn't see the word kill on page 18 or pages 17 & 19.

So essentially you have a doorstop or paperweight. Your radio
is "bricked" because you killed it. I don't know if there is a way
the consumer can resurrect it. That would defeat the purpose
of the kill function which could be used to disable the radio if
it were stolen and you figured out what frequency it was listening to.
 If there is nothing in the manual, then there may be a way to un-brick
the radio by pushing a combination of buttons while pushing the
power button, or maybe a jumper inside. But those would be secrets
of the manufacturer and that's probably who you'll need to ask. Or
maybe your dealer might have been told the procedure if one exists.
I'm fairly confident there is a way to unbrick the radio. The CPU is
probably running when the radio is attached to 12 vdc the only thing
the radio does not respond to the pwr switch.

Oddly that is page 23 in my manual. Where did you find the signaling to remote kill the radio? Obviously it can be awakened remotely with the correct signaling. What is the state of the radio? Does it power up and give you a message that it is disabled?

I do not know how you determined that "Remote Kill" is the function you turned on.

Is it possible that you turned on Function 21-LOCK, the "Keypad Lockout" function? It is on page 23 of the manual or page 29 in Adobe Reader.

Regards,
Randy

In order to use remote kill you would either have to know the 5 Tone sequence. Same goes to awaken the radio. I cannot find any reference to either in the manual, only how to turn on the 5Tone encode and how to set the 5Tone self ID. Nothing about setting or using it for kill/awake. So I'd like to know what the user was "playing with" and how he ended up turning on whatever got turned on, what the radio does/does not do in this state. Some of the TYT hand helds have a remote kill and to shut that off you have to enter a password. Maybe one you previously set up. Or maybe a factory code.

It seems like the "user" screwed up BIG TIME, by doing
something he did not understand.
The only thing I can suggest is to try and send the same
code he sent to KILL it,
this MIGHT wake it up.

Yeah most of us who like to push the envelope have screwed up.
But this isn't a fatal error. It is a useful function of the radio
to be able to awake and sleep it remotely. And I don't think a
mere toggle of the DTMF string will awake it. Right now I might
give part of an arm an a leg to know how the hell he knew how
to arrange a 5Tone DTMF string for a kill. Maybe that way a meeting
of the minds could offer the solution. I have friends in the land mobile
business that deal with commercial gear that have remote kill. This is
so a lost radio can be deactivated and preserve the security of the agency
using them. Kenwood and Icom have these systems.

It seems like the "user" screwed up BIG TIME, by doing something he did not understand.
The only thing I can suggest is to try and send the same code he
sent to KILL it,
this MIGHT wake it up.

This is located in the DTMF menu on the right of the
software. In there is a remote stun and remote kill
option. On page 18 of the manual it talks about the remote
kill and how to turn it on... But it does not tell how to
turn it off. I left the radio powered off and disconnected
for a day and was still unable to bring it back. I hope
this helps answer the questions you had. I will be around
to answers anything you can think of me to try.

Nick,
Speaking from a commercial radio knowledge base (and I hope I'm wrong as far as Anytone is concerned), but the difference between a "Stun" and "Kill" in commercial radio parlance is:
Stun Disables a radio's transmitter, so that it can no longer transmit until reset by a radio tech with appropriate programming software.
Kill Disables the radio entirely (no functioning whatsoever) and can't be brought back without appropriate software and possibly the use of a reset keyword that would have been previously programmed in.

We don't know how Anytone has implemented these two features. We should probably get some guidance direct from Anytone engineering as it sounds like you've 'bricked' your radio using the kill feature. Did you store the radio's programming info on your PC before you enabled and sent the Kill command? If so, have you tried forcing a reprogram using this data file? Or will the radio not even respond to your programming computer?

Milton (or anyone else with info)

Do we have a better understanding of how exactly the external speaker jack on the radio is wired/expected to be used? It sounds from your description they've chosen to use a stero 3.5mm and then only wire up the Right Channel conductors and it only puts out audio from the left-side band of the radio, is that correct?

Anyone else have any observations?

Yes it is as I said, IF one sends the tones to kill or stun the radio, which has to be done from another radio and both radios must be programmed to do so, then we will need the procedure from either the factory or the supplier to "revive" the affected radio. Unless the one who killed it has the code to revive or restore the radio.

What I am wondering and perhaps is not clear here is what was done to accomplish the killing of the radio? Is it a bad thing that has happened? Yes, but it is a learning experience because if we learn this we will have another level of protection should we have any 2 or more units (HT and Mobile, mobile mobile, HT and HT) that we can access and control should they fall in the wrong hands.

So, unless I missed a post, what was done to kill the radio? Tones had to be set up and sent to the radio from another radio.

Thanks,
George

Ok going to try to answer all the question I can.
I am the end user as well as the programmer. I did set up the remote kill. To do this you must attach the radio to the computer to program the codes to kill and stun the radio. Under the DTMF button on the right of the screen in programming there is an option to enter the kill and stun dtmf code. I set it to 1234 to try it out. It does work well. I have not been able to unkill it. After looking at the AT-588 (mono band radio) it has the same feature but says that it can be woken up by sending the remote kill code plus the # key. That did not work for me.
I can still read the radio but when I try to send the programming to it it comes back and says that the radio has been killed and cancels the write to the radio.
I am not a newbee to radios. I have worked on them for years and do lots of programming with systems much worse than this.
I would like to find the fix so we can make note of what to do if this happens.
I hope that answered the questions... I am watching and answering as soon as I can.
Thanks for all the help and suggestions so far.

What good would it do to have the kill if it was easy to revive the radio.
The kill feature is ment to permanently disable the radio so as it cannot
be used.
The stun feature is ment to disable the radio.
Now maybe Anytone does this in another way but to me the term "kill" means
the radio is dead.
Period.

Ok now we may be getting somewhere. I do have a spare control head that I can play with if necessary. Let me ask you this. I haven't look at the software for a while. Does it not have a place you can also enter the DTMF string to awaken the radio? Seems un-logical that it would allow you to set kill tones and not awake tones. And if you did not enter awaken tones, you may be screwed unless there is a programmer's back door. A lot of time programmers will create a back door as a short cut. But this isn't usually published.

This excerpt is from a KenWood add on the net

All NEXEDGE® system operational modes - conventional, trunked and networked - share exceptional feature benefits. The 65,519 IDs for a conventional system and 60,000 IDs for a trunked system accommodate large fleet and multi-user shared systems for dispatch talk group calling and individual private unit-to-unit calling. Unit ID/Group ID validation facilitates subscriber access and call privileging. Paging reduces unnecessary voice traffic and each subscriber unit stores the last 5 pages for recall. Especially useful on mobiles, a voice storage option can be added for stored-voice message paging. Emergency features can alert a dispatcher, a supervisor or a whole talk group to a unit in distress. The All Group Call feature supports system/facility-wide general, emergency or evacuation communications. Also, NEXEDGE® original Over-the-Air Alias provides instant caller ID regardless of fleet programming. Remote Stun and Kill features temporarily or permanently disable lost or compromised subscriber units to prevent system interference, while Remote Check enables a dispatcher to make non-voice in-range subscriber unit checks. All subscribers have simultaneously voice and GPS capability for automatic fleet tracking.

It looks pretty permenant to me.....

This application seems to apply to Fleet operation with a dispatcher.

Jim, I think the Anytone design is to allow remote
shut down and awaken. Now granted there may be
something lost in the translation. And that may be
the key. One can always go to Anytone China
and send them support questions directly. I will
be getting my radio back inside so I can play
with the settings seeing I have a spare control
head from a prototype radio that I am going to
part out anyways. Maybe I can find out the differences
then between kill/stun/activate/revive etc...
I sure can't find much on the internet.

Or will the radio not even respond to your programming computer?

Info from the net...

Yaesu and I-Com also list the remote stun and kill feature.

Some of them have an imbedded serial code in the radio that is involved in access

It makes sense but it sure is news to me.....

Ok to me that sounds like more than sleeping waiting to be awakened.
Logically remote sleep would be powered down to save a battery.

It's in more of a stun condition and
may take advanced tech software to revive.

I don't think you have much of a choice other
than to contact your dealer. He may be willing
to swap control heads with another radio. That's
where all the guts and glory are for the CPU control
and memory for system and user settings and channels.

Yes, use a stereo 3.5mm jack and the RIGHT channel output
if you want both side of the radio on the external speaker.
With the LEFT side I think you just get the left depending
on the speaker control setting. But if you just want both on
the external, wire it to the RIGHT side. Forget which connection
it is but you'll know how to figure it out.

Milton (or anyone else with info)

Do we have a better understanding of how exactly the external speaker jack on the radio is wired/expected to be used? It sounds from your description they've chosen to use a stero 3.5mm and then only wire up the Right Channel conductors and it only puts out audio from the left-side band of the radio, is that correct?

Anyone else have any observations?

Normally on Motorola SIP systems, the controller would be able to unlock it. But for these, if you have another radio that can send DTMF tones like the AT588 to the stunned radio, it should awaken it. Reviving a stunned/killed radio with itself should be impossible to do so. It would defeat the security purpose of killing it. I doubt you keyed up your radio and it read its own code and killed itself. You should have only been able to kill/stun it by TX'ing the DTMF codes to it from another radio. I cant see how your radio would have an option to `kill' itself. If so, it would be a `Suicide' option, wouldn't it? Use another radio with the same ID string. It might require the 1234# code plus the unique ID code the radio has. Search through the software to see if you assigned it a ID code and use the DTMF string to see if it unlocks it. I just cant see keying up your own radio would `suicide' lock it. It had to be done from another radio. Hope this helps.

Yes it wouldn't make sense to kill or stun a radio
and then just toss it in the trash because nothing
could revive it. So I believe there to be engineering
software needed to revive the radio if accidentally
killed or stunned that wipes the radio's programmable
memory clean and then allows it to be copied over fresh
from firmware the next time you hit the pwr switch.

It would be get ahold of this software if it exists. And
make a archive of it and upload it to the files section.

No kidding! LOL that's just plain stupid. Or there is no real remote sleep/wake function, just remote stun and kill. I guess this is keeping in tradition that the radio can be used in the business/profession realm and if lost of stolen, can be disabled to protect the user from unwanted transmissions on their frequency. However, how many different radios out there that can access the same frequencies? Plenty. Well I guess you'll have to wait for some input from someone who can provide some software to reflash or revive or maybe an unlock code. I'll keep researching, keep an eye out for some good news. In the meanwhile try Qixiang's website for some support, the URL is on the box.

Good luck.

At lunch today with a Motorola service friend, I brought up the Kill option.

He said that most ALL Motorola radios used in commercial service have the Stun and Kill option available, but the function must be activated (registered) by the local supplier of the radio.

To each individual radio that has had the actual kill signal sent to, it requires a special code available only the person that registered it.

He indicated that the kill command must include a specific radio identifier, so as not to affect other radios.

He did not seem too anxious to discuss it.

I've sent some email off to Qixiang about this. First one
bounced from my provider's outgoing server. Something
about spam this or that. Second I sent via Yahoo. Hopefully
I'll get some response. I thought before I plucked the LCD
and mic jack out of a prototype control head I have that I
would brick the control head with a stun command. But as
Nick said, there is no field in the software to enter a revive
code. This makes me believe the radio does not have a remote
function to allow a user to turn it off or on using DTMF.
We have to start getting some answers to this pretty damn soon.

Making the software generally available, ie even to this select group, defeats the original design purpose of the kill feature. The purpose is to poison a stolen radio and render it useless. If an "un-kill" were widely available, that feature would be lost and the radio would be more of a theft target.
I have great sympathy for the experimenter that this has happened to. It could easily have been any one of us. My only suggestion at this point is to retain the proof of purchase receipt, because eventual access to any un-kill facility should surely require this document as proof the radio was killed through accident only.

I have worked on the AT-289 handheld from Anytone, and to reset a stun or kill, you need a second piece of software from Anytone which is normally not provided to a end user. I will ask for that software and make available to you all so we don't have bricks laying around here in the US.

Sincerely
Trygve

Ok to me that sounds like more than sleeping waiting to be awakened. Logically remote sleep would be powered down to save a battery.
It's in more of a stun condition and may take advanced tech software to revive.

I don't think you have much of a choice otherthan to contact your dealer. He may be willingto swap control heads with another radio. That'swhere all the guts and glory are for the CPU controland memory for system and user settings and channels.

Yes there is power when I turn the radio on and can see activity on my home channels. I am unable to change anything on the radio. I ahve tried sending the code again to unlock it but that did not work. I am trying to contact my supplier now to see if he has any ideas. I will try anything to figure it out. Hope that I do not have to send it back to the manufacturer to have fixed. That would take some time to ship.

THanks

Nick

Unkill facility? Hardly going to happen. Remember this is a cheap Chinese radio
not an Icom, Motorola or Kenwood with stateside support. Ideally the support
should be provided by the retailer. It should not have to be shipped back
to China. How would that be for your business to wait weeks or months
to have a disabled radio awakened? It would make me think twice about
who I purchased my next gear from. No, it's not going to be good enough
to wait around for something to happen. We need answers soon, right now
we are just chattering about it with nothing definite.

Subject: Re: [Anytone_AT-588UV] Re: Remote Kill

Making the software generally available, ie even to this select group, defeats the original
design purpose of the kill feature. The purpose is to poison a stolen radio and render it
useless. If an "un-kill" were widely available, that feature would be lost and the radio
would be more of a theft target.

I have great sympathy for the experimenter that this has happened to. It could easily have
been any one of us. My only suggestion at this point is to retain the proof of purchase
receipt, because eventual access to any un-kill facility should surely require this
document as proof the radio was killed through accident only.

But Milton, If he bought it from an overseas seller (which I think might be the case) then I'd expect he'd have to return it to that place for a possible solution. I doubt the Radio mfg'er will be setting up a stateside authorized repair facility (which is likely to be what is needed to un-kill the radio). When you kill a Motorola radio it either has to go to a Motorola Authorized Service Center, or back direct to Moto. Depot Repair in El Paso Tx. They would of course require documentation and a statement that the person returning the radio is the authorized owner/user and I can see no end of trouble if this were something trying to be done long-distance in China (or wherever) due to communications and language difficulties.

This will be an interesting/important story to continue to follow, because I'm sure Rick won't be the first/last person to kill their radio.

That's my point Jim. The logistics of getting the radio revived
are very unfavorable for now and in the near future.
So what are the options? Be bummed out because you mistakenly bricked
your AT-588UV and wait possibly months for Qixiang to set up authorized service facilities
that can, with the right documentation/proof of ownership un-brick the radio?
Or do we make some noise and try to get service software that can be used
by the registered owner to un-brick their radio? I'm for the latter solution.

708. AT-588UV dual in band receive?

Yahoo group: Anytone_AT-588UV
Date: 2012-12-31 15:05:18 UTC
From: John P. Lloyd
Topic: 576 Message: 708

Hello,
I have a strange issue with my rig;

If I try to receive two two meter frequencies, the "B" is always muted, no matter where I put the "mute" setting.
If the "B" is on a 440 repeater, it receives both sides no problem. It seems only when both sides are on the same band.

The "A" receives both fine.

Any suggestions, or am I missing something!

Best for a happy and healthy new year for everyone and their families!

I think you've encountered another bug. My radio # 19 to roll off the assembly line has some amusing oddities related to which side UHF or VHF is on. And this has been confirmed by others. Let me ask you this, how far is the radio from the antenna?

The antenna is about some odd 30 feet from the rig on the roof. It is a comet tribander (2, 220, 440) that runs through a triplexer, and then back into a duplexer for 2/440.

If the 2m station that i wish to just "monitor", what I can do is to use the "B" side; then I can monitor the "A" side no issues.

I normally use a separate 2m rig, but right now I have most of my antennas down as I am in the process of a tower refurb.

Any word from Ed on when or if these issues will be resolved?

Topic: 576 Message: 715

Since the radio has a built in duplexer why would you run an external duplexer and a triplexer?
Not that this would cause mute problems I'm just curious. I haven't had a problem with the mute function in my experiments but I don't run the radio in dual band because of a birdie problem I have on a 155mhz frequency that interferes with the opposite side of the radio. If I park the radio with the 155 mhz frequency on the left side it interferes with the VHF channels on the right and visa versa. Shifting the CPU clock does nothing. But it only seems to be one
particular frequency so far, our local PD. And no I don't know what kind of plans are in the works
to address these issues, just that it was said they would.

Why so many ...PLEXERS in line ? The radio already has one built-in,
One day, compare your signal in and out with and w/o the ...plexers.

The antenna is about some odd 30 feet from the rig on the roof. It is a comet tribander (2, 220, 440) that runs through a triplexer, and then back into a duplexer for 2/440.

If the 2m station that i wish to just "monitor", what I can do is to use the "B" side; then I can monitor the "A" side no issues.

I normally use a separate 2m rig, but right now I have most of my antennas down as I am in the process of a tower refurb.

Any word from Ed on when or if these issues will be resolved?

Hello,I have a strange issue with my rig;
If I try to receive two two meter frequencies, the "B" is always muted, no matter where I put the "mute" setting.If the "B" is on a 440 repeater, it receives both sides no problem.
It seems only when both sides are on the same band.
The
"A" receives both fine.
Any suggestions, or am I missing something!
Best for a happy and healthy new year for everyone and their families!

Hello everyone,
I want to thank you all for the help. I was able to get the radio un-killed. I talked to my dealer and he had received some software that gave him the ability to un-kill the radio. I have not tried the software that was uploaded but will try it. So I am very happy to say that at least the dealers will have the ability to un-kill or un-stun a radio.
Thanks
Nick

I'm fully aware of the losses involved with the duplexers and triplexes
I have a triband Antenna
2 m 220 and 440
The triplex or has three outputs, one for 220
This feeds my 220 radio
I now have two outputs one for 440 and one for 2 m
In order to feed this to my dual band or I have to recombine them

Normally I use the tri-band antenna for three separate radios
And I normally have a dual band antenna up for the dual banders

I'm in the midst of redoing my antenna system which is why I have the crazy duplexer/triplexer Set up
I know it's lossy but I'll get there.....

Well if you were able to use the software you might want to share
it and upload it to the files porting of the group. Qixiang sent me
software yesterday to unkill/unstun but it wouldn't work with my radio.
Said radio type mismatch. So you may consider sharing what you have
so we can keep it available here.

Not sure if you can just turn a duplexer around to have a common
radio input and separate UHF/VHF antenna outs. I used one on
an Icom 706 MkIIG to combine separate UFH/VHF outs on the radio
into a dual band antenna but I'm not sure it could be used the other way.
It's just an isolater and band pass filters so I wouldn't see why it couldn't
be used either way.

Happy New Year's Darrell,
You sure can as long as your spec's for the duplexer match those of your antennas. There isn't a directionality associated with which way the combination goes. You may realize better RF performance if the mono-band antennas have gain for the respective bands they operate on.

Cheers

Jim G.

Yes a happy one to you too, that is what I'm thinking, after all when they are used the way they are designed they both receive and transmit through the same aerial, I think I'm correct?

Yes, Darrell/Milton, you can turn them around, there is no directonality
and RF Power handling capbility would be the same no matter which port you
transmitted into.

Well that is good, sounded too simple.. also resolves issues of uhv being
used above the 430 MHz range

Traditionally a duplexer would be two tuned cavities for a repeater setup using two antennas. I've seen duplexers marked or designated "backwards" to use with a quad band radio with one SO239 and two dual band antennas 2/.70 and 6/10 meters. But for all practical purposes you can use one dual band radio like the AT-588UV and two mono band antennas with most any duplexer.

Yes a happy one to you too, that is what I'm thinking, after all when they are used the way they are designed they both receive and transmit through the same aerial, I think I'm correct?

Subject: Re: [Anytone_AT-588UV] AT-588UV dual in band receive?

Since the radio has a built in duplexer why would you run an external duplexer and a triplexer?
Not that this would cause mute problems I'm just curious. I haven't had a problem with the mute function in my experiments but I don't run the radio in dual band because of a birdie problem I have on a 155mhz frequency that interferes with the opposite side of the radio. If I park the radio with the 155 mhz frequency on the left side it interferes with the VHF channels on the right and visa versa. Shifting the CPU clock does nothing. But it only seems to be one
particular frequency so far, our local PD. And no I don't know what kind of plans are in the works
to address these issues, just that it was said they would.

The antenna is about some odd 30 feet from the rig on the roof. It is a comet tribander (2, 220, 440) that runs through a triplexer, and then back into a duplexer for 2/440.

If the 2m station that i wish to just "monitor", what I can do is to use the "B" side; then I can monitor the "A" side no issues.

I normally use a separate 2m rig, but right now I have most of my antennas down as I am in the process of a tower refurb.

Any word from Ed on when or if these issues will be resolved?

Hello,
I have a strange issue with my rig;

If I try to receive two two meter frequencies, the "B" is always muted, no matter where I put the "mute" setting.
If the "B" is on a 440 repeater, it receives both sides no problem. It seems only when both sides are on the same band.

The "A" receives both fine.

Any suggestions, or am I missing something!

Best for a happy and healthy new year for everyone and their families!

Topic: 576 Message: 733

Here is what I recieved from Ed after my radio shipped. It has been returned and I believe this well clear the below issue.

Hope it helps and think it will correct the problem below:

****
Email from Ed.

Engineer found there is 2 problems in these 100pcs AT5888UV,

1) when transceiver in UU or VV mode, the sub band no RX.
it is caused because of CPU software updating, the previous 50pcs have no this problem.
Now the solution is we send you a Hi-writer, and send you the CPU software,
then you update the current 100pcs by yourself.

2) The RJ-45 jack board has problem.
Last time i shipped 54pcs RJ-45 jack board, please don't ship the board to end users,
it is still not correct one, engineer said inside 1 resistance is incorrect.
i will send you 154pcs RJ-45 jack board together with Hi-writer,
all of the radios must change with this jack board.

Really sorry for the inconvenience caused,
because the production is a bit rush and it is a new model/

We are on purchasing Hi-writer now, will send you asap.

When your radio arrives, please just refuse delivery. Do not open the box, disturb the label or etc. Just write REFUSED on the box and give it back to the postman. This way the radio will be returned to me. If you do not refuse delivery, it will be necessary for me to send you a return shipping label for you to send it back. This will delay the replacement time.

The only upside to this mess is that, in the future, I will have the ability to upgrade any firmware changes to these radios. I apologize for the delay in getting these radios out. Anytone gave me a shipping date of mid-December for 300 radios. I am sure they are working as hard as they can but believe me, no one is more anxious to get these shipped as I am.

If anyone would like a refund, just let me know. As soon as the radio is returned, I will take care of it.

really good stuff.
I'm very pleased to see that they have both acknowledged the issues, and have also done their best to solve them. wow.
I suspected the first production runs would be a little buggy...but most companies just tell you to wait for the next one and buy a new radio...this approach is pretty good considering what most of us have come to expect from chinese manufacturers.
a big +1 to the at5888uv guys lol.

Subject: [Anytone_AT-588UV] Re: AT-588UV dual in band receive?

Here is what I recieved from Ed after my radio shipped. It has been returned and I believe this well clear the below issue.

Hope it helps and think it will correct the problem below:

****
Email from Ed.

Engineer found there is 2 problems in these 100pcs AT5888UV,

1) when transceiver in UU or VV mode, the sub band no RX.
it is caused because of CPU software updating, the previous 50pcs have no this problem.
Now the solution is we send you a Hi-writer, and send you the CPU software,
then you update the current 100pcs by yourself.

2) The RJ-45 jack board has problem.
Last time i shipped 54pcs RJ-45 jack board, please don't ship the board to end users,
it is still not correct one, engineer said inside 1 resistance is incorrect.
i will send you 154pcs RJ-45 jack board together with Hi-writer,
all of the radios must change with this jack board.

Really sorry for the inconvenience caused,
because the production is a bit rush and it is a new model/

We are on purchasing Hi-writer now, will send you asap.

When your radio arrives, please just refuse delivery. Do not open the box, disturb the label or etc. Just write REFUSED on the box and give it back to the postman. This way the radio will be returned to me. If you do not refuse delivery, it will be necessary for me to send you a return shipping label for you to send it back. This will delay the replacement time.

The only upside to this mess is that, in the future, I will have the ability to upgrade any firmware changes to these radios. I apologize for the delay in getting these radios out. Anytone gave me a shipping date of mid-December for 300 radios. I am sure they are working as hard as they can but believe me, no one is more anxious to get these shipped as I am.

If anyone would like a refund, just let me know. As soon as the radio is returned, I will take care of it.

I have to agree, and have no complaints really with mine. It is super sensitive and not hard to operate/get in to. I have never seen a radio that was not "buggy" in one respect or another, no matter the mfg. It's like the "new" channel for 60 meters; Yaesu wont provide info on changing this issue but CHIRP or the wide band software mod will do it all in a heartbeat.

I firmly believe that the only "dumb question" is the one not asked....

really good stuff.
I'm very pleased to see that they have both
acknowledged the issues, and have also done their best to solve them.
wow.
I suspected the first production runs would be a
little buggy...but most companies just tell you to wait for the next one and buy
a new radio...this approach is pretty good considering what most of us have come
to expect from chinese manufacturers.
a big +1 to the at5888uv guys lol.

I'd agree also. In addition to the tinny audio from the internal speaker, the limiting in transmit audio and the missing digits on side A when the LCD is cold, there are all fixable. I already have a good LCD and mic jack board from a prototype 588UV. The speaker, I just use an external. 1000% better audio. Tonight I was talking on VHF and the radio just died! I thought what the hell! I grabbed the fuse holder and the radio lit back up and I talked another 30 minutes. Now I have to look at that LOL. Either the fuse is badly soldered inside which I have seen plenty in 34 years, or it's not tight in the clips inside the plastic holder. I still use it on side B and turn the sub band in this case side A to display the input volts. There is a problem with certain frequencies that interfere with each other if they are active at the same time. That's probably a firmware issue but I have always used my Yaesu FT8900 the same way. Mainly because the mute sucks on the Yaesu, it only slightly reduces the volume on the sub band and there is no way to adjust it :(

what about the external speaker jack problem? Was that issue resolved? If I recall you had to play around with the plug to get the external speaker to work.

Use a stereo 3.5mm plug. The right channel carries both
sides of the radio without setting the radio in setup.
If you set the radio to ext then the right channel only carries
side A. My memory isn't clear but I think this is how it
works. You can alway give it a try yourself and if I'm
wrong then correct me.

Well if you were able to use the software you might want to share
it and upload it to the files porting of the group. Qixiang sent me
software yesterday to unkill/unstun but it wouldn't work with my radio.
Said radio type mismatch. So you may consider sharing what you have
so we can keep it available here.

Hello everyone,
I want to thank you all for the help. I was able to get the radio un-killed. I talked to my dealer and he had received some software that gave him the ability to un-kill the radio. I have not tried the software that was uploaded but will try it. So I am very happy to say that at least the dealers will have the ability to un-kill or un-stun a radio.
Thanks
Nick

I'll be adding the QPS588UV un-kill software in the files section for this group. The AT-588UV un-kill is already there but doesn't work with any radio that has a serial number sticker stating the model is AT5888UV, at least not mine. Once I make sure the QPS software will read from my radio I'll make it available in the files section also.

Dear All,

There are 2 software programs offered - one for the first AT-588UV, and then one for the AT-5888UV models. I have booth if anyone needs - trygves@...

Well if you were able to use the software you might want to share it and upload it to the files porting of the group. Qixiang sent me software yesterday to unkill/unstun but it wouldn't work with my radio. Said radio type mismatch. So you may consider sharing what you have so we can keep it available here.

Subject: [Anytone_AT-588UV] Re: Remote Kill

Hello everyone,
I want to thank you all for the help. I was able to get the radio un-killed. I talked to my dealer and he had received some software that gave him the ability to un-kill the radio. I have not tried the software that was uploaded but will try it. So I am very happy to say that at least the dealers will have the ability to un-kill or un-stun a radio.
Thanks
Nick

Ron,

I have the Anytone and am very satisfied. I have red specs and reviews on the Wouxun and own a KG-UVD1P and love the HT. I chose the Anytone as a STRONG dual-bander for two main reasons:

1. I could buy it from Ed at importcommunications.com To me, being able to buy from a trusted, reputable entity is very important and Ed is certainly that and more. Trust is a hard thing to come by in these days of internet ordering and drop shipping from an unknown warehouse. It is refreshing to know there IS someone on the other end that cares and who will do the right thing.

2. Spec wise the two radios are so similar and if you are considering cost at all, by and large the Anytone will save you some money. But, if you refer to 1. above and the savings were not there I would buy from Ed anyway.

I am not saying there are not any reputable firms out there, there are. But if you find a good one you stick with it. The Anytone is a great radio. The modulation is loud, the receiver sensitive and the programming easy. Power out is just fine at or above spec. At this moment I am listening to two 2 meter repeaters. One local and the other in the next state south of me and copy is 100% on both.

That's my 2 cents and i hope it helps.

I have one of each and they have a lot of similarities. The wouxun has a better display but the Anytone has separate controls for each band, a speaker on the front of the mic, indicators on the mic as to which band is active and a large band selector switch in the mic.

I decided to order the Anytone and will receive the next shipment from China in January. I have NO experience programming these radios. I am running Win7. Any suggestions on how to get started now while I am waiting for the rig? I will do both manual and computer ptogramming it. Is the mauual prgramming same as Yeasu? Any suggestion on how to get up to speed on the software?

Www.importcommunications.com is where I got mine from. They have the programming cable and a link to the software and instruction on how to put your frequencies in before you get the radio.

Walt,
Yes the programming is similar to the Yaesu and Wouxun via the mic direct freq entry :) I love that! If you have ever used CHIRP (free, supports many radios, has a user group) you might try that for other rigs but not the Anytone yet, it will be developed soon. The Anytone software is really easy indeed. On the Win 7 make sure you have the correct driver/cable/comm port. Those and directions are on Ed's site! I bought 2 older XP machines as ALL of my ham software works virtually plug and play on XP and XP PRO. HRD also. CHIRP will also handle most HF/VHF/UHF freqs.

Hope that helps,
73

Anytone has had their growing pains. The first few radios off the
assembly line had some oddities. I think mine is #19 off the line.
I wouldn't hesitate buying the 5888UV. My radio has a quirk or two.
But the factory has bent over backwards to assist me in straightening
it out. I have almost 30 years history in two way radio communications
and have access to sophisticated commercial and cellular test gear. But
it isn't a big issue to me and I haven't done anything about these couple
of quirks with the first 50 off the line. I do know Anytone are good people.
And that's important to me.

754. Face Bracket & Radio US Availability Update ...

Yahoo group: Anytone_AT-588UV
Date: 2013-01-09 17:17:11 UTC
From: advancedspec
Topic: 754 Message: 754

Update on the Remote Face Bracket & US Radio availability ..
We have just been informed that the Face mounting Brackets will be ready at "the end of the month" ..
They Have just shipped us 80 of our 100pc initial order via DHL, & the remaining 20 pcs are to be sent at the end of the month w/ the Remote Face mounting bracket.
We have been told by AnyTone that these are the latest FCC approved production, & do not have any of the mic jack board / CPU firmware quirks that were in the units initially produced in the last quarter of 2012... We expect them on or about Tuesday.

757. In-Band Repeat

Yahoo group: Anytone_AT-588UV
Date: 2013-01-12 05:09:16 UTC
From: steverundquist
Topic: 757 Message: 757

The literature that I could find on the AT-588UV didn't answer a few simple questions. The Part 90 (90.267(e))group C low power pool of UHF itinerant use frequencies come mostly in pairs, separated by 5 MHz transmit/receive. The FCC rules allow the hand held radios to have two watts output power, and the mobile units to have six watts output power. I would like to be able to use the AT-588UV as an in-band repeater in a closed system (no connection to other repeaters, no cross-band), and wouldn't mind purchasing a duplexer, or perhaps even a second radio if needed. Here's the setup: I park my truck on a hill, overlooking a public event that my organization is managing communications for. The truck has an AT-588UV installed, and a yagi antenna in the bed pointing down at the event. Hand held UHF radios are handed out to event organizers to manage the event while communicating through this temporary hill-side repeater. Can the AT-588UV be used this way? If so, would a duplexer or a second radio at the repeater point be needed?

758. Re: [Anytone_AT-588UV] In-Band Repeat

Not only would that be illegal, it is physically impossible for the radio (ANY radio with a single Coax Port) to do.

I don't understand why would this be illegal under part 90? I am not that knowledgeable about part 90, but I know commercial radios have repeaters and the radio is approved for use under Part 90. The physically possible way of doing this would require 2 radios and a repeater controller like the one sold by Arrow Antenna for $125.00 or so. Some interfacing would probably be required between the repeater controller and the radios. This U-repeater Controller is an interesting repeater controller. I have one for use on the Ham bands for emcomm use and it should be easy to intereface..

You will need two radios, a duplexes and a controller connecting the two radios together.

When repeating with 1 radio you are asking it to both transmit and receive simultaneously. To do this you must prevent the tx signal from feeding into the rx circuit. The radio's internal duplexer can easily do this when cross banding because of the huge difference between the tx & rx frequencies. But with in-band repeating you need much greater isolation hence the needed external duplexer & two radios.

Once you have 2 radios you need a way for the receiving radio to key up the transmitting radio and to feed the incoming audio to the transmitting radio. Hence the need for the controller connecting the 2 radios.

So in short you need a complete repeater.

The issue of legality is that it's not type accepted for that part of Part 90. The radio's design would have to be limited to the power allowed for vehicular repeater service (I believe it's 5 watts or less). The fact that the radio can do 10X that on VHF is the problem.

And yes, you'd need two radios and an external duplexer to do inband repeating, but I suspect the Anytone receiver (and transmitter) aren't robust enough to operate in this fashion... unless you used a very WIDE split (20+ Mhz). This due to the fact that the receiver function is rather sloppy in terms of front-end overload and image rejection when compared to a mono-band traditional commercial radio (Rotormola, Kenwood, etc) which costs 3 to 4 times more than the Anytone. My Receiver observations are based on my unit which is one of the 'first 100'. so your mileage may vary.

I don't know how easy it would be to develop the Carrier/PL Detect signalling to run the repeater controller unit, either.

The literature said that the radio IS part 90 " type
accepted ", however it may be more trouble then it's worth
to try and make a "LPI" (Low Power Industrial) repeater
from TWO AT-588(8)UV radio's.
It would be a better deal to get a couple 5 watt handhelds,
a controller and duplexer for about the same cost
as 2 - AT-588(8)UV radio's, and have a repeater that is
"built" for the purpose, or you could buy one already
built for around $700.00, and you would know that one is legal !

I would be happy to advise, off list.

Thanks to everyone who responded to this question. I am sure that the AT-588UV is probably a fantastic radio for everything that its manufacturers claim it will do. But it would probably not be an optimal choice for this application. Another option I am considering is to use two Baofeng uv-5r radios, a $95 Radio-Tone RT-FDR1 controller, and an $85 SGQ-450 duplexer. Anyone who's got a better idea, let me know.

One person responded with a question about legalities. I have scoured Part 90 pretty thoroughly, and 90.247 seems to support that "any station authorized to operate on a mobile service frequency above 25 MHz may be used as a mobile repeater to extend the communications range of hand-carried units", subject to some conditions there that the AT-588UV seems well suited for. Perhaps the people at Anytone can create features to support UHF 5 MHz offset repeat functions in a future product release.

Overheating could be a "problem", if usage becomes heavy,
but a fan should take care of that.
Most commercial "low power" repeaters use transmit and
receive modules from handhelds, put it their own little box
with a bigger heat-sink and fan to keep the whole thing cool,
should the temp get over xxx degrees.

Trying to use a duel band radio, with a front end as broad
as a barn door would not be my first choice.;-)

766. Anytone programming software manual

Yahoo group: Anytone_AT-588UV
Date: 2013-01-13 20:32:32 UTC
From: John
Topic: 766 Message: 766

Hello all - is there a manual that details what the different options and fields mean in the Anytone programming software? I'm starting to prepare for my AT-5888 arriving and have a few questions.

The software has a SM/AM Auto checkbox that I don't understand its function and then another SM/AM drop down box that allows choices of AM or FM. I know 2M / 70 cm should be FM and aircraft monitoring on AM. Do I need to choose these or by checking "SM/AM Auto" does the radio somehow know the proper setting? Thanks for your help.

The radio won't receive in the AM mode higher than the aircraft band
regardless of your selections. At least mine wouldn't.

Hello all,
I was just wondering where I stand on Ed's shipping list. I know in one message he said that it was difficult to tell where somebody stood on his list. So, I was wondering if someone that received their radio lately could tell me when they ordered theirs. It might give me an idea of where I stand.
I just looked it up and I ordered mine Nov 29.
Thanks

In my last communication with Ed, I think he said that the shipment (from China) was scheduled for Jan 15th (which is tomorrow) . If they ship on time ????. it will probably take a week or so till Ed gets them. I'm looking for mine also. I do believe that Ed is very sincere about getting them out as soon as he can. I have dealt with him before.. also, I do not know how much time the programming issues may have affected the order.

In the beginning, Ed was the only one that advertised them and took a flyer on the project. I now see several other vendors advertising sales with similar delivery dates. I'm not sure how well Anytone is equipped to handle this quaintly of units

I'm going to include a copy of this memo to Ed. in the BCC file (address will not show on this communication) I expect that He is very busy and I hesitate to call and bother him.

Backing off it a couple inches helps. Talking across also can help.
Setting it to 12.5 khz cuts it down but also does the same for the RX.
I should be getting some service literature on these one of these days.
Hopefully there are some actual mechanical adjustments for overall
power out, modulation, etc... My radio measures 32 watts on our
General Dynamics R8000 test set on UHF and 58 on VHF. I'd like to
pump the UHF up to 40 and if there's a power adjustment for UHF
inside that would be cool. No reason why there shouldn't. The factory
was unclear, maybe purposely, on if there radio had a service mode
and soft pot adjustments. I thing it does but Qixiang is pretty tight lipped.

I think Ed has radios to flash the firmware on.
He has to open the radio body on each and plug
a firmware flasher to update both the front and rear
microcontrollers. He already works 12 hour days
and says it will take 15 to 20 minutes per unit to flash.
I'm not sure how many of these he has to flash but
I know the firmware troubles are affecting the delivery
dates somewhat. Hopefully Ed will have a look at the group
and chime in himself with an update.

I feel he is busy as well. I don't want to be the one to slow down his effort in getting the radios shipped. That is why I posted here. And, I things haven't gone as planned for him and have no problem with the way he has handled everything.

I was just getting curious. I am headed south at the end of the month and would have liked to have had the radio installed by then. But, if I don't get it by then it will give me something to do down there other than replace everything that has corroded from the salt air in the last year

I JUST RECEIVED THIS FROM ED. FYI

JIM

Jan 14 @ 2pm

Here is the latest information.

On Friday morning, DHL tracking showed the 100-radio shipment out for delivery. The only problem was, they were out for delivery in Orlando, FL and I live in North Carolina. It seems that DHL used my street address (32801) as the destination zip code. After a phone call or two, it seemed like the problem would be corrected.

This morning (Monday) the newly assigned tracking number showed a blank page. Three or four phone calls later, plus a more newly assigned tracking number shows the radios with a driver headed to my correct location.

While I wait for them, I will begin printing shipping labels. As these print, you will receive a tracking number from Stamps.com. This tracking number will not show up in the USPS system until my Post Office actually scans the radio.

The firmware-writing device arrived this morning via FedEx (no problems with FedEx). Jason and I will concentrate on shipping from the incoming 100 radios and in the evenings, I will begin updating the firmware in the 100 radios that arrived last week. This will be somewhat time consuming. The top cover has to be removed to update the main firmware, plus the microphone boards must be replaced and that firmware updated. It will take some time for each but we will ship them as quickly as possible. The updated radios will be EXACTLY the same as the ones arriving today.

Orders will be shipped in the order they were received and we'll work as quickly as we can to fill them all. Please don't email asking where your order stands in this list because it's hard for me to give an answer. Each order in my shopping cart is assigned a number, but not all these orders are for the mobile radios. There are lots of gaps in the number sequence for other equipment that has already been shipped.

Regards,
Ed

I feel it's worth it. Not so if I had to send it out. I have
access to General Dynamics and IFR test gear just a mile
away from me. The RX is great, Just want the TX to be
the best it can be even though it might not make much difference
you never know what an additional 8 watts might do in an
unusual circumstance. Factory spec is 40/25/10/5 UHF.

You are correct. To increase the receive signal at the other end 1 S unit
you need to either a) double the power out (ERP) or b) raise your antenna
twice as high as it is.

Last I heard the shipper got his account number mixed up with
his zip code and the radios were shipped by mistake to Florida.
This was a couple days ago and with a fair degree of certainty
I think he probably has the radios at his facility by now.

Thank you, That is what I am hoping. I'm thinking how shipper's can mess things up.
I'm certain that if he has them, he is well occupied in getting them out and we
should not bother him.
Forgive me, I'm just getting anxious.

789. UPDATE for Import Communications customers

Yahoo group: Anytone_AT-588UV
Date: 2013-01-17 17:49:36 UTC
From: Milton Hywatt
Topic: 789 Message: 789

Ed asked me to give everyone who purchased a radio
from him to give you all very patient people an update
as of 1/17/2013.

Ed says he's shipped 100 radios in the past two days.
He is now updating firmware in his previous inventory.
He must replace the mic board in the head, update the head
firmware, remove the top cover on the
body and update the main firmware. He says it's very time consuming. Probably 20-30
minutes per radio counting the unpacking, repacking and etc. And he has to work carefully
as not to scratch anything.

Updated radios will be shipping the first of next week. These will
be EXACTLY like the recently arrived new inventory. Only difference
between the updated inventory and the recent inventory is the updated
inventory will have the updated mic board and the updated firmware.
Ed says an additional 100 radios are supposed to ship at the end of
this month from China.

So as you might guess Ed is working night and days shipping radios
and applying the updates to his previous inventory. Plus I'm getting
a new radio too! Mine was part of the first 50 and had a problem
with the mic board and some oddities to the receiver that I documented
on a General Dynamics R8000 test set and sent my results to Anytone
in China. So both Ed and I have been working hard to see that all his
customers get trouble free radios.

Milton, List Owner and AT-5888UV Guru.

If your radio wasn't part of the hundred he shipped

over the past two days then it will be one of his stock
that he will be updating the firmware and replacing the
mic board. And those will go out on Monday. The next
slated new stock from China is supposed to ship from
China near the end of this month. So your radio should
have been shipped or will be shipped Monday. I don't
understand why I didn't receive email confirmation
from stamps.com because every other item Ed has sent
me always was preceded. He sent me a replacement
from his new inventory as they probably sent Ed the
new radios along with the mic board replacements for his
older inventory. He usually uses USPS and stamps.com
sends you a tracking number. Now I haven't received a
tracking number yet so I don't know what has happened
to it. I do know that if Ed said he shipped the radio, he shipped
it. Between Ed and I it takes 3 days to get on my doorstep.
Last item took 4 because of Christmas. But one radio I ordered
on Saturday and it was here on Tuesday. One good thing about
USPS your parcel doesn't sit in a terminal on Saturday it's on
its way to its final destination before going out on the truck
for delivery on the next weekday.

Ok well that stands to reason. He goes to China for their
electronics expo :-) I go to or try to go to Hamvention
in Dayton Ohio every year. But that's about 310 miles
from my location so it isn't a big drive and I drive my
Ford Econoline van that I've converted into a mini motor
home. Plenty good enough for a couple weeks stay. 250 horse
7.2 L Powerstroke V8 diesel. Camper hookup for electricity
but no plumbing. That's ok a 5 gallon bucket is fine for me :-)
Got a small Honda generator that will run 24 hours on 2.5 gallons
gas but keeps my beers cold LOL and the lights and sometimes
heat on. If I could afford one of those big $100,000.00 monsters
I would probably have one. But when I look back to my youth
riding a Harley with only a sleeping bag tied to the sissy bar
and a saddle with some jerk and toilet paper the Econoline
is like a mansion.

No, I was asked by Qixiang to make this info private. But if you have some general figures, I've posted them before. Things like sensitivity, RF power out, but nothing deeper that I got into with the R8000 which revealed quite a bit. I'll be going over the current production model soon. But I want you to be clear my data was culled from #19 off the assembly line. Since then much has been improved, call it growing pains or what have you. Most of the anomalies have been cured via firmware updates. The microphone preamp board AGC problem as been fixed with replacement of that board. This only concerns holders of older stock of the radios and has no impact on radios arriving in the US within the past week. If you do get new older stock radio rest assured it will meet or exceed the specs of the new arrivals from China.

Ed says he's shipped 100 radios in the past two days.
He is now updating firmware in his previous inventory.
He must replace the mic board in the head, update the head

firmware, remove the top cover on the
body and
update the main firmware. He says it's very time consuming. Probably
20-30 minutes per radio counting the unpacking, repacking and etc. And he has to work
carefully as not to scratch anything.

Updated radios will be shipping the first of next
week. These will
be EXACTLY like the recently arrived new
inventory. Only difference
between the updated inventory and the recent
inventory is the updated
inventory will have the updated mic board and the
updated firmware.
Ed says an additional 100 radios are supposed to
ship at the end of
this month from China.

So as you might guess Ed is working night and days
shipping radios
and applying the updates to his previous
inventory. Plus I'm getting
a new radio too! Mine was part of the first 50 and
had a problem
with the mic board and some oddities to the receiver
that I documented
on a General Dynamics R8000 test set and sent my results
to Anytone
in China. So both Ed and I have been working hard to see
that all his
customers get trouble free radios.

Milton, List Owner and AT-5888UV Guru.

Ok well that stands to reason. He goes to China for their
electronics expo :-) I go to or try to go to Hamvention
in Dayton Ohio every year. But that's about 310 miles
from my location so it isn't a big drive and I drive my
Ford Econoline van that I've converted into a mini motor
home. Plenty good enough for a couple weeks stay. 250 horse
7.2 L Powerstroke V8 diesel. Camper hookup for electricity
but no plumbing. That's ok a 5 gallon bucket is fine for me :-)
Got a small Honda generator that will run 24 hours on 2.5 gallons
gas but keeps my beers cold LOL and the lights and sometimes
heat on. If I could afford one of those big $100,000.00 monsters
I would probably have one. But when I look back to my youth
riding a Harley with only a sleeping bag tied to the sissy bar
and a saddle with some jerk and toilet paper the Econoline
is like a mansion.

Milton, thanks for the update you passed along. Just to clarify, if I have not received an email that my radio has been shipped, it will be the end of the month before I should expect any more radios to be shipped? Thanks & tell Ed to hang in there, most of us understand what he is going through best 73 Doug

trying to enter a 155.2425 and a 155.3025mhz frequencies in.

Step = <any>
Channel Spacing = 12.5k

everytime I enter in any frequency that needs in 0.0025, the software switches it back to 0.0000.

What am I doing wrong?

For those freq.s you'll need to do two things.
Change your radio to "NARROW" (12.5Khz channel bandwidth) (Menu Item #43)
Change your Freq. Channel Step Size (Menu item #3) to 2.5Khz

The radio's PLL will step 2.5, 5, 6.25, 12.5 etc...
Not sure if the software can select 6.25 because
I haven't tried it. You may have to enter that channel
directly from the radio. Let me know.

I checked my spam folder. I have won a million bucks and have been offered free insurance, things like that. I know it's a problem with stamps.com. As I said, it will be here when it gets here.

I only live around six hours drive or so from Ed.

I really enjoy reading about the good, the bad and the funny on these new radios. I'm sure I will have my problems with the loose nut on the mic button.

Take care.

I'm able to enter (and save into memory) 155.3025mhz. I'm not able to use the software (or save as a channel).

I did email Ed in the hopes that the manufacturer is working (or will work) on an update to the software. there is several basic functionality pieces missing. Alternatively I'm hoping that either CHIRP and/or RTS is onboard to support AT-588UV radio.

□

I placed my order by telephone so Ed does not have any order info in his computer that came direct (via internet) from me.

I'm just hoping that it doesn't get separated from the other orders.

I expect that I will know after next weeks mailing notices.

So you are able to enter and save using the radio. What happens when you read from the radio after you've saved it into memory using the radio? Does it then appear in the list or not?

I'm able to enter (and save into memory) 155.3025mhz. I'm not able to use the software (or save as a channel).

I did email Ed in the hopes that the manufacturer is working (or will work) on an update to the software. there is several basic functionality pieces missing. Alternatively I'm hoping that either CHIRP and/or RTS is onboard to support AT-588UV radio.

Using the panel on the radio. I am able to enter 155.3025 and save it as a memory (i don't see a way to edit channels).

when i download the config to the computer. In the programming software 155.3025 will show up in the hyper1 list, but when I click on the frequency field, the frequency is changed to 155.3000.

This same issue occurs for any x.0025 or x.0075 frequency I try.

Basically narrow band not supported supported via software.

That's what I figured. Like I mentioned before the radio PLL steps down to 2.5khz so there should be no reason you can't hand program that in. And the reason you can't edit channels on the radio is because you have to copy the channel to VFO, do the edit, then copy it back to the channel. Most radios are like that with the exception of some Chinese walkie talkies like the Wouxun that you can put into the "dealer" mode and edit channels directly. Thanks for your input to the group I'm sure many will find it valuable since the software pretty much is a figure out on your own deal

Milt, List Owner and AT5888UV guru.

I have not delved into that yet but if they are
anything like other radios with hyper memory
allocation, they can be used to group
memory channels into your preference.
That way you don't have to scan through
all the channels you might have in the main
memory. You can recall a hyper memory bank
and scan it individual. I'm going to get more
familiar with the software this evening just
so I don't give out any inaccurate info.

I've programmed it for my local repeaters using the software downloaded from the site.

For now, it looks like you have to type in the receive and transmit frequencies manually (instead of just setting + or -).

I had no problems with the computer connecting to it via USB or writing the program to the radio.

I'm still figuring everything out, but I don't see where you can chose to show the channel name instead of the frequency.

Item # 37 on the radio set mode choose between frequency, channel, or name. Channel and Name will give you the alpha name you have chosen for the channel. Channels will give you the alpha name plus a channel # indicator.

As far as I know there is no automatic repeater offset mode in the ARS. I prefere to program a few channels into the radio at first using just the radio then read those into the software. That will give you a general idea of how to use the software.

I do not have my radio yet, but my QPS588UV Ver 1.0.0 does accept 155.30250 with no problem. Narrow band is just 12.5K Channel Spacing.

We have several 7.5 KHz frequencies, i.e. 155.0475. Some Kenwoods are NARROW BAND RADIO and will take all the 12.5 KHz frequencies, but not our 7.5 KHz county frequencies. Now the Kenwoods are up for grabs a Ham Radios as I have some.

Don't get channel spacing and channel steps mixed up.
No I don't think you have I just wanted everyone to
think about the differences.

I do not have my radio yet, but my QPS588UV Ver 1.0.0 does accept 155.30250 with no
problem. Narrow band is just 12.5K Channel Spacing.

Milt,
If you look in the manual when in ARS setup U turn it on to
have auto repeater offset function in use. also if in the software
you let SM/AM set to am and set the auto SM/AM to on it will auto
select the Mode also, but if you set to FM with the auto SM/AM on it
will go to the opposite mode on the left band (A) and the proper
mode on the right band (B)

Mike W3MJB

P. S.
Got mine yesterday and have it all programed and in my car last night
for use today!

At 05:17 PM 1/18/2013, you wrote:

My AT-588UV has yet to arrive, but I am looking forward to using a good quality desk top mike.

Manual shows inputs on mike plug ok but I haven't yet found any info on type of mike (dynamic, condenser, carbon, crystal etc) (hi lo Z)

Bet somebody knows, would you share it with me?

Although I can't be 100% certain, the element inside the
microphone housing looks to be a small condenser/electret type.
Those are typically low impedance.

Once you get the hang of it it isn't that hard or time consuming
to hand enter channels. I did it when I first got my Yaesu FT8900.
I put 25 channels in by hand. When you want to edit a channel you
just copy it into the VFO, edit it then overwrite the channel you wanted
to edit. I sat in my recliner with the control head off the radio and used
a little 5 amp supply to power it while I did the programming.

So I guess until some software comes out that will handle what you
want to accomplish unfortunately you don't have many choices.

Subject: [Anytone_AT-588UV] Microphone requirements

My AT-588UV has yet to arrive, but I am looking forward to using a good quality desk top mike.

Manual shows inputs on mike plug ok but I h
aven't yet found any info on type of mike (dynamic, condenser, carbon, crystal etc) (hi lo Z)

Bet somebody knows, would you share it with me?

From: jwheatleyus
Topic: 830 Message: 830

Mine came in the mail today without any prior notice. Looks great- probably worth the wait. Programming worked first try using existing USB drivers in my XP machine (I already use a number of programming cables for various radios). There are a number of ways you can crash the software, so be sure to Write to the radio and Save the file OFTEN. Not really too buggy, but if you get any error, it will crash and lose your data.
When I plugged the speaker/mic, the Tx keyed continuously. Opened the mic and rearranged the PTT parts and fixed it. A rubber part was just out of place and had the PTT switch pressed.
Have not had time to check Rx sensitivity and Tx power yet, but the radio appears normal and hits local repeaters.

Got mine today, too! Ordered from Ed 11/20. No notice from Stamps.com - great surprise!

Programming from WIN7 went perfectly. All working fine, excellent reports on VHF and UHF repeaters. NO problems, and quick scan with service monitor looks excellent.

Limitations so far are all between my ears!

833. Programming AM frequencies

Yahoo group: Anytone_AT-588UV
Date: 2013-01-20 14:31:33 UTC
From: Gary Gruesbeck
Topic: 833 Message: 833

I received the radio, also without warning. I received an excellent signal reports with it. I love this little radio and I am working with the software to program it. A couple of things I've noticed. The software will not allow you to program a 300Mhz to 400Mhz AM frequency as an AM frequency but all 100-200Mhz - OK. It also skipped about 10 frequencies on the "B" side but copied all on the "A" band when I last programmed it (for frequencies 31 through 40 skipped in band "B"). It does not offer the option of programming a receive only frequency there also. It gives a "TX frequency out of range" warning and then an error message and crashes sometimes when that message is acknowledged. As previously posted, be sure to save your work often!
Have not figured out what the " hyper" function of the software will do for you yet. Can anyone explain it?
My only comment so far on construction so far is that the connector for the hand mike to radio feels a bit weak. I could forsee some structural problems with it in the future. I have not used the radio mobile yet, so we will see. I will post more as I can.

You don't edit in the memory mode. You can copy a memory channel into the VFO complete with all the specifics regarding tones, repeater offset (if any) channel spacing etc... then copy that back to the channel you wish to edit. In the manual under chapter 6, page 14 it tells you how to edit the channel. You do it in the VFO mode. Since it is a shortcut feature the manual does not go into depth telling you what you are doing exactly but it does tell you exactly what to do.

Yeah if you are getting that error about a string or something
then when you close that the program disappears, the way to
get around that is to make your additions/changes, save it to
the same or a different file, then close the file being displayed
and then open the one you just worked on. You can then write
to the radio without crashing. It's really nothing wrong with your
PC it is the software because I have tried it in Win7, Vista and XP.
One thing I have found out regarding the Prolific drivers included
in the QSP software is that you have similar Prolific devices like I
do, one for an ADMS chord and one for the Anytone cord that
the Anytone chord will grab the first Prolific driver it finds. And
even if it installs ok which it will, it will not work with the Anytone
cable. You MUST install the drivers before you plug the chord in.
And try to use the same USB port. Each port will enumerate a unique
ID string to the driver and if you plug it into five USB ports it will
install a driver each time. Trust me, I've messed around with this for
a couple hours trying to screw things up just so I would know how
to resolve conflicts.

The software is buggy so you may be having issues with that.
And the AM programming is normal. All the bands are available
only on side A if you use the radio to go through them and AM
is only enabled on the aircraft band 118 - 136. I don't know if
I worded that correctly but I think after bit I'll bring my radio
in from the SUV and see what I can come up with. Hope that
helps a little. If not I'll have a better detailed answer later today.

Topic: 837 Message: 837

Ok, I've been trying really hard to translates some considerations and functions described in the owner's manual. A good bit of it is concise and to the point and adequately describes what the user should do to accomplish this or that. But there are a couple issues that I've come up against that have me a bit perplexed.

1. What the hell is Standby Mode? Is that different from VFO or Channel Mode?
2. If so how do you enter the 'Standby Mode?'

The reason I ask is because some radio operation/function instructions start off by saying "In standby mode...." or "In channel mode..." or "In VFO mode..."

And some functions that involve alternate functions of the set/low buttons. Also it says the radio "Prompts DU DU or just DU. I just though about this while typing. Does that mean it beeps out DU in morse code? Because it doesn't display DU on the screen.

Oh and also, can you edit the home channels to stay edited? If I change the frequency then go mack to VFO or Channel Mode when I go back to Home, the frequency reverts back. I haven't used home but I know on my Yaseu walkies you can program home to be a simplex calling frequency of your choice within the band. Nothing in the software regarding Home channels.

And finally has anyone figured out these Hyper Channels? Left and right, hyper channel 1 and 2, L-108 blahblahblah etc... Maybe I just have too much going on in my head to understand the scheme. Also when you want to enter the hyper channels it say again "While in standby mode press the volume knob for more than .5 seconds and something is supposed to happen which doesn't LOL!

I've got a pretty decent grasp on how the radio/software works except for these couple of things. Oh and I've noticed a little oddity in scanning. If you scan both VHF and UHF channels on one side say side B. And the radio is stationary on a VHF frequency on side A, as side B scan through your channels, when it goes from a VHF channel to a UHF channel it makes an audible click. Not really loud though. And this is with the main band being set to side A. Now, if you switch the Main to side B, then skip the UHF channels, the click goes away. Just thought I'd ask in case someone else has run across this. It's not really annoying, just odd.

Can you maximize the program to cover your entire desktop and then hit
the print screen button while holding down the ALT key? I can't remember if there
is a print function in the software or not but if you haven't found it, it's probably
not there. If that's the case a screen shot would be the only easy way.

Download the free PC Screen Capture www dot pcscreencapture dot com/ (replace the word dot with periods, yahoo thinks a URL is spam). The file is exe and doesn't need to be installed so you can keep it on your desktop. Double click to open the capture application while your QSP software is up. You can probably pin the capture application to your task bar so it will open on top of the QSP software which needs to occupy the full screen. In the menu bar of Screen Capture you will find the capture options. Choose full screen and soon you will see your desktop screen with the QSP inside the Screen Capture software box. In the top left of the menu bar choose Save As. Now I didn't get that far but I imagine it will give you options to save as a jpg or bmp in the location of your choice. If this is too difficult for you to follow then find someone with a little more computer savvy. And that wasn't mean as an insult, I don't know the degree of your computer skills so it could all make good sense or no sense. But that's how you use the software. I tried ALT + Print Screen and it didn't work for me either. Same with CRTL+P. Sometimes on more elaborate keyboards it takes FUNC+INSERT. I think you can also use Microsoft Paint, included in every version of windows. Just type in the start box 'paint'. I'm not sure how to do a screen capture with it but I'm sure it's similar to PC Screen Capture.

Some as myself may find that older or even newer drivers
for the PC50 programming cable may already exist on your
PC. I've found that you must first install the drivers that come
with the QSP programming software. The date and version of
that driver is: 7-26-2012 / 3.4.36.247. New drivers that your
computer will download and install from Microsoft Update
(especially if you use Windows 7) will not work. You can go into
the device under COM and LPT ports in device manager and you
will see Prolific USB to serial adaptor. And it will properly install.
But it will not communicate with the radio. At that point you must
go into the device properties and uninstall it. Then you must install
the driver found in /program files/QSP5888UV/ you will see
the exe file that says driver install or something like that, I forget
exactly but it's obvious. If that program finds more Prolific drivers
you must choose uninstall if it presents you with 3 choices. Follow
the instructions thereafter. After you install the correct driver you must reboot.
When you're back, plug the PC50 into a USB slot, preferably one
you can use for the cable all the time otherwise the driver will install
with a different COM port number on different USB slots. You might see
dialog when you plug the cable in for the first time, you might not.
Go to the Control Panel/Device Manager and scroll down to COM and LPT
ports, expand that to verify the Prolific device shows and make note of the
COM port. Go into the Prolific properties and check the driver date and
version making sure it is what I listed above. If so, close out the control
panel dialog and head to the QSP software. Set the COM port to match
the device COM. Plug the cord into the radio, turn it on.
Try to read from the radio. If you get an error saying
can't open the communications port, turn the radio off unplug the cable
from the USB slot and plug it back in. The turn the radio back on and
try again. It should work. The software is buggy. Always read from
the radio first. Then work on the file. When you are done, save the file
as a unique file name. I use the date and a letter. First edit of the day
would be 1-21-13.dat second in the same day would be 1-21-12-a.dat
and so forth. Save the files in the QSP5888UV directory, it's the default
location the software looks for data files. Before you write your data
save it. Most of the time the program will crash unless you save the file,
then reopen it and then write. I went through all this yesterday just to
see where those who aren't as savvy as I with Windows, hardware, and software
and the quirky driver problems you can run into, have some reference
when they find themselves in a vicious loop which does happen and you
want to smash your keyboard :-)

Just a little FYI

Milt.

ctrl-p is not a global hotkey ... It is commonly (e.g. MS Word, Excel, IE, FireFox, etc) implemented by individual programs to bring up the Print dialog -- where what it is printing is up to the program.

PrtSc (or PrntScrn or whatever your keyboard maybe labeled; and especially on laptops may require the "Fn" key as well) will take a full screen capture and put it in the clipboard.
Alt-PrtSc will capture just the current window, and put it in the clipboard. (This is probably what is wanted for the original question)

You can then paste into MS Word, Outlook, Gmail, MSPaint, or anything that can work with images. For example,
Start->Run and type "mspaint" (no quotes) and hit enter. (or find MSPaint in the start menu probably under "Accessories" somewhere)
And paste (ctrl-v or shift-ins or use the menu item), and you'll see the screen shot! Then you can modify or save or whatever you want to it.

~~~~~
Has anyone looked at the data file that the software saves settings in? Might happen be human-readable (or good enough), in which case just open it in notepad (or word) and print it.

Yeah I think I mentioned ALT+Print Screen the first go around. The user said that didn't work. Full screen the QSP software, hit ALT+ Print Screen. I think I forgot to mention to use Microsoft Paint then paste the clipboard into it. Was in too much of a hurry. On a MacBook Pro you press Command Shift 3 and it captures the entire screen and saves it as a .png file to the desktop. Pretty easy.

If you purchased a radio from Import Communications they
come with the PC50 programming cable, radio mounting
bracket and hardware, and instruction manual.

Cool, be sure to read my FYI on getting the cable to work
if you run into problems. My problem is I have other
Prolific cables I use with my Yaesu radios. The Anytone
cable likes to grab those drivers unless you uninstall the
other drivers of which you can reinstall after the Anytone
cable is installed with the 7/2012 drivers. Hope you enjoy
the radio it is definitely a keeper and great bargin for the
sophistication level the radio encompasses.

Milt.

Windows has a clip program that you can select as little or as much as you want and when you let go it show up in a dialog to save. However it also automatically goes to the clip board.

Hope this helps,

Windows has a clip program that you can select as little or as much as you want and when you let go it show up in a dialog to save. However it also automatically goes to the clip board.

Hope this helps,
73

Yeah I think I mentioned ALT+Print Screen the first go around. The user said that didn't work. Full screen the QSP software, hit ALT+ Print Screen. I think I forgot to mention to use Microsoft Paint then paste the clipboard into it. Was in too much of a hurry. On a MacBook Pro you press Command Shift 3 and it captures the entire screen and saves it as a .png file to the desktop. Pretty easy.

Subject: Re: [Anytone_AT-588UV] Re: Printing

ctrl-p is not a global hotkey ... It is commonly (e.g. MS Word, Excel, IE, FireFox, etc) implemented by individual programs to bring up the Print dialog -- where what it is printing is up to the program.

PrtSc (or PrntScrn or whatever your keyboard maybe labeled; and especially on laptops may require the "Fn" key as well) will take a full screen capture and put it in the clipboard. Alt-PrtSc will capture just the current window, and put it in the clipboard. (This is

probably what is wanted for the original question)

You can then paste into MS Word, Outlook, Gmail, MSPaint, or anything that can work with images. For example,
Start->Run and type "mspaint" (no quotes) and hit enter. (or find MSPaint in the start menu probably under "Accessories" somewhere)
And paste (ctrl-v or shift-ins or use the menu item), and you'll see the screen shot!
Then you can modify or save or whatever you want to it.

~~~~~
Has anyone looked at the data file that the software saves settings in? Might happen be human-readable (or good enough), in which case just open it in notepad (or word) and print it.

>
>Download the free PC Screen Capture www dot pcscreencapture dot com/ (replace the word dot with periods, yahoo thinks a URL is spam). The file is exe and doesn't need to be installed so you can keep it on your desktop. Double click to open the capture application while your QSP software is up. You can probably pin the capture application to your task bar so it will open on top of the QSP software which needs to occupy the full screen. In the menu bar of Screen Capture you will find the capture options. Choose full screen and soon you will see your desktop screen with the QSP inside the Screen Capture software box. In the top left of the menu bar choose Save As. Now I didn't get that far but I imagine it
>will give you options to save as a jpg or bmp in the location of your choice. If this is too difficult for you to follow then find someone with a little more computer savvy. And that wasn't mean as an insult, I don't know the degree of your computer skills so it could all make good sense or no sense. But that's how you use the software. I tried ALT + Print Screen and it didn't work for me either. Same with CRTL+P. Sometimes on more elaborate keyboards it takes FUNC+INSERT. I think you can also use
>Microsoft Paint, included in every version of windows. Just type in the start box 'paint'. I'm not sure how to do a screen capture with it but I'm sure it's similar to PC Screen Capture.

oh come on guys, we've had about 6 inches of snow over the past 48 hours, over two inches 2 days before that.
We had a warm spell where it went to 36 degrees for 3 days, then within 24 hours plunged to minus 27...and that is totally normal for january in northern alberta.
Imagine, going from water dripping off everything, and actual rain coming down, to minus 27 with a minus 34 wind chill within a 24 hour period...consider the road conditions after that lol.
Thankfully I don't have too much sidewalk real estate to shovel around here.
We get big fines if we don't shovel sidewalks within 48 hours of a major snow fall.
And hey, we even have electricity and gas service up here in the frozen north, imagine haha.

Regards
Colin

Hey Colin. Did you have to pump out the water that dripped inside your Igloo too? It was horrible trying to stop the living room from melting away here in Ottawa.

Thankfully the snow was sticky so I was able to just build a new addition quickly and with the cold it's now all hardened.

863. Received the new radio

Yahoo group: Anytone_AT-588UV
Date: 2013-01-22 18:58:43 UTC
From: n1mn@att.net
Topic: 863 Message: 863

I got my new radio in the mail this morning. I will be unpacking it a little later.

My daughter went to the mailbox to check the mail and walked around the box on the steps. The mailman set it there on top of the rest of the mail.

73's all.

865. Possibble delay in shipments?

Yahoo group: Anytone_AT-588UV
Date: 2013-01-23 02:32:41 UTC
From: wowxxi2002
Topic: 865 Message: 865

For what its worth I picked this up from another yahoo group. For those of us waiting for delivery in January, lets hope it will not be delayed into the Chinese New Year! Below is not related to Anytone.FYI.....

This might be of interest to some of you...

"The Chinese New Year holiday is very special to us, especially to the Chinese workers.
For most of the EU countries, USA or even Australia, the workers only need to work max 40 or 45 hrs per week.
However, in China, or even in Hong Kong, we work at least 12hrs per day , 74hrs per week.

And we don't have much public holiday or annual leave.
That's why the Chinese holiday normally last for 2 weeks.
And this year, it will last for almost 1 month.
So that the Chinese worker can have enough time to travel back to their home town.
To see, to visit, to give a hug or even a kiss to his family, friends, wife, husband, etc.

I never explain this situation in the past 10 years, and simply put the announcement on the web site.
I want to state clear in this newsletter and try to explain the real situation.
As my sales support team really do great job in the past 10 years for me, and the most important, for my customer(you.)
And I hope you can understand why we cannot make the shipment during the Chinese New Year Holiday.
We need the factory to supply the stock to us, which may not fulfil your exception.
That's why I want to have an apologize here first and hope you can understand."

This was accompanied by the attached image, showing the Chinese New Year beginning on the 25th of Jan. and ending on the 25th of Feb.

Based on this announcement ther may be a slowdon in shipments from China

868. Hyper Channels??

Yahoo group: Anytone_AT-588UV
Date: 2013-01-23 17:13:25 UTC
From: jwheatleyus
Topic: 868 Message: 868

Has anyone really figured out how to use the Hyper Channels? Pressing the Vol knobs per Manual Page 15 causes the display to change to VFO but I have not figured out how to use the result. Long press on R/H Vol turn on alarm!
My radio works great and I have a fair understanding of all the buttons, features, and programming, but the Hyper Channel scheme is over my head.

I haven't figured it out yet. There is dialog in the programming software to enter some frequencies and there are if I remember correctly some frequencies in there by default. They looked to be organized by band so maybe just examples, I don't know.
And there seems to be a couple other radio operations that don't seem to function. All these the manual says to access while in 'standby mode.' What mode is that? They also mention a channel mode and VFO mode. Well I understand those two but what is a standby mode.

Nobody seems to know the difference, nobody responded to my post where I asked. I suppose sooner or later I'll find out. I can always email China and ask I suppose.

Pretty sure "Stand by" mode just means not transmitting.

That's what I thought. But there are some functions
including the hyper channel function that don't
seem to respond to key or knob presses. And if
you read through the manual, they mention channel
and vfo modes. Maybe it's just a case of poor translation
and wording. Maybe standby mode is when neither side
is scanning and you are in the channel mode. Oh well
I guess I'll see if I can program a repeater into hyper 1
using software. Maybe you can't recall hyper channels
unless you put some in it?

From: hayden4x4
Topic: 872 Message: 872

After I downloaded a program into the radio it seems as though the up and down buttons on the mic quit working, I can't get them to do anything. I remember them working before to change frequency in VFO mode. Has anyone else come across this? Is there a setting I messed up in the software?

Thanks
Hayden

It is a slide switch immediately below the up/down buttons.

It locks just those buttons.

883. Hyper Channel Revisited

Yahoo group: Anytone_AT-588UV
Date: 2013-01-23 21:42:12 UTC
From: jwheatleyus
Topic: 883 Message: 883

I figured out a little about the Hyper Channels- sort of neat.
Using the software, put two channels in Hyper 1 and another two channels in Hyper 2. For each channel you can select Channel or VFO for the display and enter the desired channel number. I unchecked all boxes and put Frequency and Left in the remaining selections.
Now when you press Left Vol Button you switch to Hyper 1 pair of channels. Press Right Vol Button and switch to Hyper 2 channels. Pretty neat if you need such a function.
The learning continues.....

Very cool! And that's what it is all about. Rocketing you
to a few channels with one stroke of the hand. I figured
as much but didn't have the time to scope it out further.

Good post.

Oh, so what mode are you in when you press the vol
to go to your hyper channels?

886. Menu 4, Band Comments

Yahoo group: Anytone_AT-588UV
Date: 2013-01-23 22:03:39 UTC
From: jwheatleyus
Topic: 886 Message: 886

I have not fully figured out Menu 4, Band, but it must be OFF for the VFO to cover all bands. If Menu 4 is ON, the VFO is stuck in whatever frequency band it is in- I don't know how to get it out with Menu 4 ON.

It appears that every time I write to the radio, Menu 4, Band is set to ON. If I set Menu 4 OFF, and Read and then Write, Menu 4 is back ON.

Do a factory reset (hold right side SCN button while powering up the radio) and see if that has any affect. Are you changing the screen color settings with the software or from the radio? Also if you use the software, back your channels up before you reset so you can restore them after.

And the hyper buttons are the volume controls.
You must need some freqs in there to enter
hyper mode because pushing in on the vol
controls don't get you there with a stock
out of the box radio. I'll mess with it later
because I can see now a need for it.

894. Rx Only Channel

Yahoo group: Anytone_AT-588UV
Date: 2013-01-23 22:31:40 UTC
From: jwheatleyus
Topic: 894 Message: 894

I wanted to program an Rx Only weather channel but leaving Tx Freq blank did not work. Here is what worked- In Normal Channel Edit, enter the Rx Freq. The software will put in a Tx- that is OK. Now double click the 'More' column- far right column. Another screen comes up- check Tx OFF, and select FM or AM as appropriate. Then OK and you have an RX only channel.

Yup I figgerd as much. i have other radios that
won't enter modes unless they are software setup.
I do some occasional work for Kenwood 2 way
and Hytera. There stuff can't be modified by the
end user unless a service mode is invoked.

I've posted the same thing. I don't see any way to
save changes if you manually try to edit it using
only the radio. As soon as you switch back to
channel or vfo mode the home channel reverts
back to what it was. I have other radios that
you can change the home channels to a simplex
calling frequency of your choice, this radio should
have similar capabilities.

Topic: 898 Message: 903

Go to importcommunications.com and scroll down below the radio picture
to where it says Programming Software click here and click on that to begin
the download. After you install the software, go to the folder its files are
stored in. On Windows 7 it /program files/QPS5888UV and look for the
USB cable driver installer. Install this BEFORE you plug the cable in.
Then reboot your computer. Once the reboot is done plug the cable
into your radio and open the software. You can follow the direction in
you user's manual from there. If you get an error saying can't open com port
unplug the USB end of the cable then plug it back in the same USB port.
The software can seem a little daunting at first but once you get your com
port set and you can read from the radio you can explore the program and
see how things work. Those of us using the software had no instruction on how
to use it because there are none. If you have issues setting up the com port
come back and I'll run you through the procedure. I have posted a tutorial
on that recently so you may want to read it in the message archives of this group.

904. Front Panel Bracket and initial observations.

Yahoo group: Anytone_AT-588UV
Date: 2013-01-25 06:39:12 UTC
From: w6larw6lar
Topic: 904 Message: 904

Just got my transceiver last week and spent today test driving and programming with the PC cable and software. My only question is when can we expect to get the front panel bracket? The rig is no use to me or others without this. I know its in the works and if it going to take some time getting out I will find a way to accomplish remote mounting even as temporary. I found that you can remove the front panel to rig mount and I can most likely make an adapter to mount it to and use it that way. And I found the screws to be spline type.

As for my initial observations. Everything looks fairly well done. As many before have said, there is an unusual amount of "artifacts" in the receive audio. Tomorrow I'll strap on an external speaker as the sound out of the internal speaker is not very pleasing. The software seems ok and easy to use. I'm wondering if the rig can be put into 2.5Khz deviation but haven't found anything on that yet. Tomorrow I'll run it through some testing on my comm monitor and a new RIGOL spectrum analyzer. One thing I really need to look at is the DTMF output as I tried to log to my repeaters and can't make it. I'm the Technical Liaison for my local VA Hospital Amateur radio club and if this rig turns out ok it may be a good choice to place in our patient mover vans and bus units. I'll post my observations on bench testing in a few days.

2.5K is Step Size- it works. My DTMF works fine for controlling our repeaters. Hitting the repeaters probably requires a CTCSS Tone- mine works on both CTCSS and DCS tones.

906. Rx Tone Enable- a little surprise

Yahoo group: Anytone_AT-588UV
Date: 2013-01-25 14:12:01 UTC
From: jwheatleyus
Topic: 906 Message: 906

I have Rx tones programmed in a number of channels and noticed that my Comm Monitor would open squelch without a tone- thought there was a problem with the radio. Turns out the radio appears to default to Carrier Squelch even for channels programmed with tones. On the Normal Channel Edit screen, double click the 'More' column and Change Squelch Mode from Carrier to CTCSS DCS. Must be done for each Tone Channel.

Yeah it's normal but in the software the mode setting is hidden in the More settings. This might cause some not to consider making sure the Mode is set to CTCSS/DCS. There is also another setting if I remember correctly to allow you to encode, decode or both. On my Yaesu FT8900 this is all covered in one menu item where it's off, CTCSS encode, decode, or both. A little different than the 5888UV but that's expected.

Yeah John that would be a logical assumption
since I see it no where else as a function modifier
for anything but squelch. But where would Mike
come up with this? And it would be illogical to
just make it up. I think when I head out to the grocery
this afternoon I'll give it a try since the radio is mounted
in the SUV. I do have an early serial number radio
that's in the house I could also try it on. This radio
is prior firmware update and number #19 off the
production line. So maybe it works on pre update
radios??? I'll post a message, I know there might
be a few out there like me who would like to save
a frequency for the Home button. I talk simplex
to a few folks and we use a frequency where we all
yack on. I'd sure like to set that up so I can hit a mic
button and be there.

Unfortunately you have to do a screen capture.
Search google.com for a way to do it on your
particular operating system. If you go into the
message archives of this group, this discussion
occurred about 5 days ago with a couple solutions.
Let me know if you need some additional help.

Yesterday I spent a few hours running the rig on my Comm monitor and the RIGOL spectrum analyzer. So far so good. The frequencies are right on and deviation is spec. Also the signal looks very clean on the analyzer. Now the only thing I found so far is that if I try and send DTMF control codes from the mic I'm not having much luck. But if I program DTMF memories in one of the 16 slots it works every time. So now to figure out why DTMF from the mic is a problem.

I've also tried to "Print" from screen in my Windows 7. No go. But, if you bring up the start menu and type in "Snipping Tool" you can select a partial or full screen selection and do a copy. Then use the paste function to whatever program you have and print from there. I hope that helps some of you windows 7 users.

As for 2.5 Khz.. I was talking about the "Deviation" as in "Half Deviation" in regards to 5 Khz full deviation. Some rigs have the ability to cut deviation in half. I can't find that on this rig. I am aware of the 2.5 Khz step size.

Maybe try checking the Sidetone Box in DTMF setup and see if the Mic Keypad is working. As noted in previous post y DTMF Mic does work to control local repeaters.

It's in the files section of the group located at:
groups.yahoo.com/group/Anytone_AT-588UV/files/

Look for the folder Windows Software and inside that
folder is QPS5888UV programming software. Download
the three files inside. The single file was too large for Yahoo
so it had to be split. After you download the three files
place them in the same folder on your computer and double
click on the QPS5888.zip file. I think in Windows XP and
Windows 7, the operating systems know what to do with zip
files without third party software. Your computer should
then extract the three parts of the file and recombine them into
a folder with the software inside. If you have trouble let me know
and I will provide an alternative download with one single file.
Also read your user manual and read how to install the USB
cable driver and the programming software. You need to follow
the steps exactly or you will have trouble getting the proper driver
for your USB cable.

I used the PC Screen Capture (http://www.pcscreencapture.com/download.html)solution on Windows XP, created a photo file of it and printed it. No problem.

I think the keys in Windows are CTRL + PrintScn.
That captures the entire screen. Then you
open paint and select new and when that
pops up you can paste the contents of the
clipboard to that blank image canvas. On
my MacBook it's command+shit+3 and it
puts the entire desktop into a .png file
right on your desktop. I've been trying to get
the Anytone QPS software to run in Mac OSX
under an API call interpreter called WINE
but haven't been able to get it to operate
reliably. Heck it isn't too reliable on my
Windows 7 machine LOL. I've inquired
to the dudes who code the Chirp program.
I run Chirp on Mac for my Wouxun UV6D
hand held. But they need a load of the 5888 radio
to modify Chirp to work with it. I'd much rather
use Chirp.

I believe the radio has three channel spacing modes, wide middle and narrow.
25 - 20 - 12.5. This is set in menu item #43. Don't know if that's what you meant
by changing deviation but it should affect both RX and TX. I do know that
when I switch my public service VHF channels to 12.5 it did increase the volume
of the voices. Set to wide there were a couple that you could hear only if you
cranked the volume to max. Then when the dispatch replied, you had to turn
back down because they were 100% louder than the mobile units. Some of it
is poor microphone habits by the mobile operators. I've also looked at the
radio on a General Dynamics R8000 communications test set. It has a built
in spectrum analyzer so I didn't need to grab the stand alone analyzer.
I was checking for spurs, deviation, stuff like that. Also looked at the RX.
I was still getting audible tone from the R8000 at -127 dBm. I did find though
that I could create intermod if I rammed two slightly different frequency signals
down its throat. The spurs weren't great in amplitude but in a high RF environment
it could be an issue.

As far as transmitting DTMF from the keypad, there should be no special
settings just hit the PTT and press the numerals. At least that's what the owners
manual says :-)

Subject: [Anytone_AT-588UV] Re: Front Panel Bracket and initial observations.

Yesterday I spent a few hours running the rig on my Comm monitor and the RIGOL spectrum
analyzer. So far so good. The frequencies are right on and deviation is spec. Also the
signal looks very clean on the analyzer. Now the only thing I found so far is that if I try
and send DTMF control codes from the mic I'm not having much luck. But if I program DTMF
memories in one of the 16 slots it works every time. So now to figure out why DTMF from the
mic is a problem.

I've also tried to "Print" from screen in my Windows 7. No go. But, if you bring up the
start menu and type in "Snipping Tool" you can select a partial or full screen selection
and do a copy. Then use the paste function to whatever program you have and print from
there. I hope that helps some of you windows 7 users.

As for 2.5 Khz.. I was talking about the "Deviation" as in "Half Deviation" in regards to 5
Khz full deviation. Some rigs have the ability to cut deviation in half. I can't find that
on this rig. I am aware of the 2.5 Khz step size.

> >
> > Just got my transceiver last week and spent today test driving and programming with the PC cable and software. My only question is when can we expect to get the front panel bracket? The rig is no use to me or others without this. I know its in the works and if it going to take some time getting out I will find a way to accomplish remote mounting even as temporary. I found that you can remove the front panel to rig mount and I can most likely make an adapter to mount it to and use it that way. And I found the screws to be spline type.
> >
> > As for my initial observations. Everything looks fairly well done. As many before have said, there is an unusual amount of "artifacts" in the receive audio. Tomorrow I'll strap on an external speaker as the sound out of the internal speaker is not very pleasing. The software seems ok and easy to use. I'm wondering if the rig can be put into 2.5Khz deviation but haven't found anything on that yet. Tomorrow I'll run it through some testing on my comm monitor and a new RIGOL spectrum analyzer. One thing I really need to look at is the DTMF output as I tried to log to my repeaters and can't make it. I'm the Technical Liaison for my local VA Hospital Amateur radio club and if this rig turns out ok it may be a good choice to place in our patient mover vans and bus units. I'll post my observations on bench testing in a few days.

Actually, if the program is similar to chirp, commander, or wouxun software try this.

Using your mouse, left click and hold over the top left cell. Then while holding the left button down, drag over to the right and then down to the bottom of your programing sheet and let off of the left button of your mouse. This should highlight all fields. Then while the fields are highlighted, right click with your mouse and select COPY. You can then paste all cells/fields into your favorite spreadsheet program such as Excel, Open Spreadsheet, etc.
Note: You can also use the mouse to select the first field, and then hold down the SHIFT key while using the arrow keys to highlight the cells. Then just use CTRL-C for copy and CTRL-V for paste.

I hope that this works for you as it eliminates many steps.

I think I'll give that a try. I've done similar with Commander, copying
and pasting cells from Commander to Wouxun. But haven't tried much
with QPS5888. I'm afraid to because it will crash if you breath too heavy.
It's crap that they've omitted an import/export to CSV file. That way you could
open it in Excel or Open Office, what I use. I wasn't going to pay the $$$$
for Microsoft Office. On the MacBook I use LibreOffice. It's available free
for Windows. I guess some of the programmers defected from Sun when
it sold Open Office to Apache and formed Libre. But yeah if that works it would be a good
way to copy and paste into a spreadsheet. I just happened to get email
from a group member today thanking me for the FN+PrintScreen suggestion.
He then pastes into Excel and it works great for him. I'd like to see Qixiang
Electron get off their butts and have some updates to their software adding
some better functionality to it and fixing that crashing issue myself along with
others have experienced.

Ok I've tried it Joe. You cannot copy multiple cells, the dialog doesn't
pop up after you've dragged your cursor across the cells while holding
the left mouse button. You can copy and paste 1 cell at a time because
when you highlight only one cell the dialog popup for cut/copy/paste
does appear. And you can paste one cell at a time from a different program.
The QPS5888 software then fills in the rest if you've pasted the RX frequency.
That may be a little shortcut if you are trying to add several channels
from other software like Commander.

Subject: [Anytone_AT-588UV] Re: Print Function

I used the PC Screen Capture (http://www.pcscreencapture.com/download.html)solution on Windows XP, created a photo file of it and printed it. No problem.

Milton is doing a fantastic job debugging the anytone radio programming. It looks like the Chinks have a pretty good radio, but don't understand English and computer savvy in good ole American Ham language.
Since I have not yet received my radio, and considering all the programming irregularities, I am be coming concerned that, by the time that I do, I will unable to go back and find all the E-mail corrections.

Let's encourage Milt to publish a Cheat Sheet list of troubles and cures that we can later make reference too. Obviously Ed is pretty busy just getting them out and when we call him, we are adding further delay to the show. I see a good Liaison opportunity here.

groups.yahoo.com/group/Anytone_AT-588UV/messages

I encourage everyone who currently owns an AT5888
to come forth with their issues off list at my email address.
That's easier for me to archive and start a digest of undocumented
functions and known issues to compile a "cheat sheet."
I have instructed Ed to forward all technical issues to me
that will free him up to concentrate on the product. I am
already a liaison for the AT5888UV direct to the manufacturer.
And the best part is I'm armed with over $100 thousand dollars
worth of sophisticated communications diagnostic equipment
via a good friend who services Kenwood and other professional
analog and digital two way communications equipment. I have
an extensive background in amateur and pro two way repair
but currently on the semi-retired list. I can't get official service
literature for the AT5888UV, the Chinese are paranoid it might
end up in the wrong hands and copied as the Chinese do. There
are several counterfeit Chinese radios being sold as the real thing.

Hang in there with us. I try to answer every question I can as precisely
and honestly as possible. And as I find bugs with the AT5888UV
I report them here. Most of the bugs are not a life or death matter
so far and I have worked out temporary solutions until Anytone
come out with some firmware updates. Only problem with that is
you cannot do firmware updates on the owner end. The radio must
be shipped back to the retailer. That sucks big time as far as I'm concerned.

Nope I won't be traveling to Orlando although I have
relatives living near there. I try to hit the Hamvention
in Dayton OH every year however. I'd like to see
Anytone make that event, I have a whole lot to
talk about. And it's about 3 hour drive from me.

HERE'S AND IDEA, TRY CTRL C AND CTRL V. I HAVE USED THE OLD KEYBOARD SHORTCUTS WHEN THE COPY/PASTE DIALOG DOES'T WORK.

Y, that's unfortunate ...

Presumably, it stores some kind of file locally on the PC that saves the settings/channels?
If you're able to determine what that file is (under the QPS5888 directory? under your user's applicationdata folder? in the registry?), could you email me a copy (dwestbrook at gmail.com)?
If it's some kind of text-based format, i'll try to write something to convert it to csv (or txt or pdf for nicer printing).

thanks,

I think I did try that and it didn't work. Even if it did you can't select the top row by dragging your cursor across the rows. One thing I didn't try was to select all by using CTRL+A. I'll give it another shot today.

HERE'S AND IDEA, TRY CTRL C AND CTRL V. I HAVE USED THE OLD KEYBOARD SHORTCUTS WHEN THE COPY/PASTE DIALOG DOES'T WORK.

There are two files it creates for each save. And I was thinking
about going that route, give the two files to a programmer I know
locally that writes software to interface or link different structured
database files from Pervasive, MS SQL server Access etc.. I think
these are ODBC data source drivers used to connect to different
sources. So this should be a breeze for him to import the .dat file
into something to convert it, he's got the tools for this.

Y, that's unfortunate ...

Presumably, it stores some kind of file locally on the PC that saves the settings/channels?
If you're able to determine what that file is (under the QPS5888 directory? under your
user's applicationdata folder? in the registry?), could you email me a copy (dwestbrook at
gmail.com)?
If it's some kind of text-based format, i'll try to write something to convert it to csv
(or txt or pdf for nicer printing).

thanks,

I don't think David was suggesting that. But the file(s)
have to contain data organized in some kind of
format. With the proper suite of conversion tools
a person could figure out how the data is indexed
and read by the software and create a tool to export
that data into a comma separated value file or even
an Excel style file.

They're not plain text, but there is text exposed in them -- can clearly see the freqs and channel names in the .dat and .fre files ... I bet that they could be reverse-engineered relatively easily (change 1 thing; save; look for difference in data file; repeat) ...

Should also be possible for a program to "read" the window to get the channel info using core windows API calls ...

Developers hook API to test there code. I used to have
some reverse engineering software that could be used
to debug/hook API calls etc.. That was probably 13
years ago. Today's software is much more involved
but certainly someone familiar with C++, Delphi
could pick apart the application and maybe write
a ODBC driver to look at the data in Access, Excel
etc..

They're not plain text, but there is text exposed in them -- can clearly see the freqs and channel names in the .dat and .fre files ... I bet that they could be reverse-engineered relatively easily (change 1 thing; save; look for difference in data file; repeat) ...

Should also be possible for a program to "read" the window to get the channel info using core windows API calls ...

Just a thought...Could you take a screen shot, print, scan and use OCR software to put it into a spreadsheet?
Then you could do whatever you want with it.

Ed from Import Comm sent me a note that a mount is coming- just don't have a date. FYI, the Faceplate Mount on the radio is removable via 4ea Torq 8 screws. It would work until the real mount becomes available- or maybe forever.

949. Sample model for CHIRP Anytone software development?

Yahoo group: Anytone_AT-588UV
Date: 2013-01-29 14:16:15 UTC
From: wth727
Topic: 949 Message: 949

I see that development is "blocked" for lack of a sample rig.

http://chirp.danplanet.com/issues/365

I have liked CHIRP very much for other radios; and this group has lots of experience in deciphering memory and storage formats, and data interchage by .img or csv files.

If others agree, could we get a loaner to the CHIRP developers, to get CHIRP for the Anytone 5888?

Just an FYI to all of you that are waiting for your radio.

I ordered my radio on November 26th. I just got an email from both Ed and Stamps.com that my unit is shipping today! I am really JAZZED! Thank you to Milton and all the users that have been apart of this user group. The information has been great and I am looking forward to setting up my unit. Please keep the information coming....

Best,

Gary

Hopefully one of the vendors will step up and loan a radio.

I'm waiting to buy a 588UV until it's supported by CHIRP. I have a UV-5R and want to be able to easily keep a mobile and the UV-5R with the same channel list.

954. Some Interesting Features and XBand Repeat Setup

Yahoo group: Anytone_AT-588UV
Date: 2013-01-30 17:02:08 UTC
From: jwheatleyus
Topic: 954 Message: 954

Looks like the Menu 55, Hnd Spk goes back to ON whenever you write to the radio. Similar to Menu 4, Band which also goes back to ON.
If you want these Menu items OFF, you must manually change them after every Write to the radio.

I just noticed two 'features' during XBand Repeat testing.
1. You can change channels with the Knobs but not with the Up/Dn Buttons during active XBand Repeat.
2. Pressing the Tune buttons does not change the Main Band during XBand Repeat, but pressing A/B on the Mic does change the Main Band from A to B or vice versa.
The factory programmers or test personnel missed a lot of 'features'.

The good news is that if I make the XBand channels Hyper 1 channels, then XBand Repeat survives power loss and comes back up in XBand Repeat mode. This is important to me because we want to use the radio for village Law Enforcement UHF to County Central Dispatch VHF in an unattended 24/7 environment. Looks like it will work.

955. Thanks for the approval and now my first question

Yahoo group: Anytone_AT-588UV
Date: 2013-01-30 17:05:04 UTC
From: Cris
Topic: 955 Message: 955

Received my radio from Ed on Monday and I've tried some sample programming.

I am not a ham. I work with the Amer Red Cross in St Louis and we respond to all house fires in St. Louis county.

So I'll be monitoring public safety freqs mostly. Transmit on the Red Cross channel (UHF Public Safety)

Have done all my programming using the software.
I have scanned most of the nearly 1000 postings in the group

So on to my questions:
1. When the radio is in scan mode...stops on one of the fire depts. when tones are set off sometimes the radio takes off scanning again while transmission still going on. Under Function Setup > Scan Pause Time > Options are TO(default) CO, and SE. Any guesses as to what these equate to?

2. I was under the impression (and not a deal breaker) that I could have All my UHF freqs (only have 2) on one side and all VHF on the other side. But don't see any way do that. Anyone? Or did I just miss understand?

3. As St. Louis is a VERY RF rich environment...I've been plagued by the cross mod. Taken the gain dual band antenna off. I've now got Left and Right squelch le adjusted per a previous post suggestion. I'll report back on that.

Looking forward to the adventure
Cris

I think the vendors are busy shipping the radios out to those who prepaid.
Once the initial flush quiets down then there is a possibility of getting a
sample radio. I have a spare here but I'm going to end up sending it back
to Ed, I haven't paid anything for it and it was once of the first to come
off the production line without the latest firmware so it has issues.
However these issues would not prevent writing code to add to Chirp
to support the radio. And if they somehow brick the radio Ed can unbrick
it with his firmware writer. I think :)

I plan to use automotive quality double sided tape
on the control head and tape it down to a flat surface
of a suction cup mount I have for an old GPS I
no longer use. I've used that tape for a Yaesu
dual bander that came with a bracket and affixed
the bracket to the console of my SUV. It will definitely
hold the control head but it can be removed without
damage and difficulty. There are brackets in the works
and should see them sooner than later.

Answers follow questions

Received my radio from Ed on Monday and I've tried some sample programming.

I am not a ham. I work with the Amer Red Cross in St Louis and we respond to all house fires in St. Louis county.

So I'll be monitoring public safety freqs mostly. Transmit on the Red Cross channel (UHF Public Safety)

If you want RX Only on a channel, double click on the 'More' column and check TX Off

Have done all my programming using the software.
I have scanned most of the nearly 1000 postings in the group

So on to my questions:
1. When the radio is in scan mode...stops on one of the fire depts. when tones are set off sometimes the radio takes off scanning again while transmission still going on. Under Function Setup > Scan Pause Time > Options are TO(default) CO, and SE. Any guesses as to what these equate to?

TO Scan stops for a defined interval- a few seconds and can't be changed. CO Stops as long as there is a carrier present. SE stops scan on the active channel and does not restart. These are pretty standard options on the new Chinese radios- LCRs.

2. I was under the impression (and not a deal breaker) that I could have All my UHF freqs (only have 2) on one side and all VHF on the other side. But don't see any way do that. Anyone? Or did I just miss understand?

Just put the VHFs in say Chan 1-25 and UHF in 50-51. Use the right and left tune knobs to select desired channel. The two sides are two independent radios that use a common set of programmed channels. Again pretty standard on LCRs.
If you have some standard channels you want to setup, put two channels in Hyper 1 and another two in Hyper 2. Be sure to set CHANNEL not VFO (two places), enter the desired channel numbers, and UNCHECK AutoHyperSave. Press Left Vol to go to Hyper 1 and Right Vol for Hyper 2. Neat feature.
JohnW
W5JHW

3. As St. Louis is a VERY RF rich environment...I've been plagued by the cross mod. Taken the gain dual band antenna off. I've now got Left and Right squelch le adjusted per a previous post suggestion. I'll report back on that.

Looking forward to the adventure
Cris

959. External Speaker

From: jwheatleyus
Topic: 959 Message: 959

I was confused by the Manual Menu 52, VSPCONT which seem to say only VHF comes out the Ext Speaker. The Ext Jack on the back of the radio is a MONO. Leave the Menu 52 set to INT (internal speaker) and plug in a Mono Speaker- the Jack disconnects the Internal speaker and both VHF and UHF come out out of the speaker

Set menu item #34 is the scan dwell time. It is on page 25
of the user manual. You would want to choose "Busy".
This will allow the scan to dwell on the busy channel
as long as it is busy. What set menu item is "scan pause time"?

As far as your channel selection per side, they make no provision
to storing on the left or right by band. It's the same on my Yaesu
quad band. The only band that will appear on one side is the aircraft
band 118 - 136. It may also behave that way on 220. You can select
left or right for your hyper memories, I haven't messed with that yet
but looked at it in software and it appears you can program more that
one frequency on each side of the radio but don't know that to be fact.

And being in an RF rich environment you are going to get some intermod
I was able to prove that using a communications monitor and sending
a couple signals into the antenna connector about 1 mhz apart. The spurs
on both sides of the main frequencies weren't large in amplitude but I
can see suffering some intermod where RF is rich with paging and other
frequencies close to your operating frequencies. Make sure your channel
spacing is 12.5khz that may help. Also I find that a setting of 10 on carrier
squelch still allows really weak station reception. Don't be afraid to use
the highest squelch setting you can that still allows reception.

Thanks John

I suspected something like that..I'm used to the "2 sec" delay in scanners

Now if I just get the cross-mod under control, I'll be a happy camper

Looks like the manual is confused also. On page 9, they show the radio rear panel upside down. And they have the ext spk jack and the tv/av jack mixed up.
the tv/av jack is labeled as 2. That's actually the ext spk jack. And yes if you use a mono plug both sides are routed to the external jack when the men item is set to 'int'. However if you insert a stereo to mono Y cord when the menu item is set to 'ext' the right side of the radio is on the right mono jack and so on for the left side is on the left jack. I tried this with a stereo 3.5mm to two RCA mono jacks and a 3.5mm mono to RCA. Right side was red, left was white. I've been using mine with an external speaker but I never realized the diagram in the user's manual not only shows the radio upside down, but has the spk tv/av jacks mixed up.

There are no other instructions for the software.
If you read they posts here, people are finding out
some functions of the radio that aren't documented.

Milton,

Great job with this group!

<What set menu item is "scan pause time"? > This in the software, under Functions Group. Based on your description, it’s the same as the scan dwell time setting from the front of the radio.

Thanks. I would just use the radio to set the dwell time to Busy.
But in the software I'm pretty sure it's as follows:
TO = Time, CO = Busy, SE = Secede.

In TO it dwells for 5 seconds then resumes scanning regardless if there
is signal and open squelch. In CO it stays on the channel as long as there is signal to open
squelch then resumes after the squelch has been closed for 2 seconds.
In SE it stops on signal and open squelch and does not resume scan until
you press scn.

I stand corrected- my mono plug just hid the stereo connections. This Stereo Output explains the Dual External Speaker shown on Page 7 of the manual. The comment about 2-conductor plug made me think MONO.

I am not sure about your 'cross mod' comment. Cross mod is generally an AM problem. Here is a site with good Rx performance information: http://www.radio-electronics.com/info/rf-technology-design/receiver-overload/crossmodulation.php

I refer to it as intermod. Intermodulation Distortion or IMD.
It's where a strong signal takes the receiver front end
out of linear operation allowing other signals to intermix
and creates harmonic spurs both below and above the
main signals. If you are hearing things other than what
you should be hearing on a frequency this is likely the cause.

You could also be hearing ACI Adjacent Channel Interference.
Same goes with Crosstalk. And all can be caused by poor filtering
or shielding, tuning etc..
